ABSTRACT

Until recently, early pregnancy detection in goats was not practical or unreliable. Ultrasonography diagnosis was reported to be an alternative and effective tool to detect pregnancy. The objectives were: 1) to determine the efficacy of ultrasonography in goat pregnancy detection, 2) to monitor the foetal development using transrectal (TR) and transabdominal (TA) probes, 3) to predict the specific and combination of structures observed for each stage of pregnancy, 4) to estimate age of foetus with specific and combination of structures observed and 5) to confirm the accuracy of specific and combination of structures in estimating the age of foetal. Pregnancy diagnosis was performed using a real-time B-mode scanner equipped with TR (7.5 MHz) and TA (5.0 MHz) transducers. Gestation period was categorized into five stages, i.e. initial, early, middle, late and final stages. In Experiments 1 and 2, a total of 9 and 13 naturally oestrus does were scanned using TR and TA probes, respectively. Foetal development and related structures were obtained as fact findings along gestation period. In Experiments 3 and 4, a total of 95 and 150 does were diagnosed along gestation period to obtain specific and combination of structures using TR and TA probes, respectively. In Experiment 5, confirmation on reliability of specific and combination of structures for each stage of gestation obtained from Experiments 3 and 4, were carried out in 75 does. The highest predictive values (100%) for specific and combination of structures during early stage of gestation were detection of sac, non-echogenic (NE) area and foetus-heartbeat-uterine wall-amniotic fluid. During middle stage of pregnancy, detection of combination on foetus-heartbeat, placentomes-foetus-heartbeat and foetus-heartbeat-spinal cord-ribs gave 100% predictive values each. Predictive accuracy for combinations of structures in late stage,

placentomes-foetus-heartbeat-spinal cord-ribs, placentomes-foetus-heartbeat-spinal cord-ribs-foetal organ; and foetus-heartbeat-spinal cord-ribs-foetal organ were 100, 80, and 100%, respectively. During final stage of gestation, only placentomes were detected and gave 100% predictive value. Accuracy on prediction of pregnancy status and age estimation for each stage of gestation i.e. early, middle, late, and final stages probes were 100, 100, 97 and 100%, respectively. Early detection of pregnancy is promising with TR probe. Images captured enable operators to determine stages of gestation in an effort to improve reproductive efficiency. TR probe is suitable for early pregnancy detection whereas TA probe is more practical to later stage of pregnancy. Both probes were needed to ensure the effectiveness in pregnancy diagnosis. Therefore, ultrasound scanning technology could be coupled with other reproductive technologies i.e. AI and cryopreservation to be used routinely and efficiently in the goat farm management. In conclusion, B-mode ultrasonography in caprine pregnancy diagnosis was efficient in detection of pregnancy as early as day 23 of gestation and gave high predictive value in estimating different stages of pregnancy using TR and TA probes.

ABSTRAK

Sehingga kini, kaedah mengesan kebuntingan di peringkat awal dalam kambing adalah tidak menyakinkan. Diagnosis pengesan ultrabunyi telah dilaporkan sebagai pilihan alternatif dan kaedah yang efektif untuk mengesan kebuntingan. Tujuan kajian adalah: 1) untuk menentukan keberkesanan pengesan ultrabunyi dalam mengesan kebuntingan 2) untuk memerhati perkembangan fetus menggunakan prob *transrectal (TR)* dan *transabdominal (TA)*, 3) untuk memberi andaian struktur spesifik dan kombinasi struktur-struktur bagi setiap peringkat kebuntingan 4) untuk memberi andaian umur fetus dengan struktur spesifik dan kombinasi struktur-struktur dan 5) untuk mengesahkan ketepatan struktur spesifik dan kombinasi struktur-struktur dalam menentukan umur fetus. Diagnosis kebuntingan dijalankan menggunakan mesin pengesan *real-time B-mode* yang dilengkapi prob TR (7.5 MHz) dan TA (5.0 MHz). Tempoh kebuntingan telah dikategorikan kepada 5 peringkat, contohnya, peringkat permulaan, awal, pertengahan, lewat dan akhir. Dalam Eksperimen 1 dan 2, sejumlah 9 dan 13 ekor kambing betina yang estrus semulajadi didiagnosis menggunakan prob TR dan TA, masing-masing. Perkembangan fetus dan struktur berkaitan diperolehi sebagai penemuan asas sepanjang tempoh kebuntingan. Dalam Eksperimen 3 dan 4, sejumlah 95 dan 150 kambing betina didiagnosis sepanjang tempoh kehamilan bagi memperolehi struktur spesifik dan kombinasi struktur-struktur menggunakan prob TR dan TA, masing-masing. Dalam Eksperimen 5, pengesahan kebolehharian struktur spesifik dan kombinasi struktur-struktur untuk setiap peringkat kehamilan yang didapati dari Eksperimen 3 dan 4 dijalankan ke atas 75 kambing betina. Nilai ketepatan andaian dengan peratusan tertinggi (100%) untuk struktur spesifik dan kombinasi struktur-struktur di peringkat awal kehamilan adalah karung, kawasan tidak

bergema dan fetus-degupan jantung-dinding uterin-cecair amniotik. Semasa peringkat pertengahan, kombinasi fetus-degupan jantung, placentum-fetus-degupan jantung dan fetus-degupan jantung-tulang belakang-tulang rusuk yang dikesan memberi 100%, masing-masing. Nilai ketepatan andaian bagi kombinasi struktur-struktur pada peringkat lewat adalah placentum-fetus-degupan jantung-tulang belakang-tulang rusuk, placentum-fetus-degupan jantung-tulang belakang-tulang rusuk-organ dalaman fetus dan fetus-degupan jantung-tulang belakang-tulang rusuk-organ dalaman fetus adalah 100, 80 dan 100%, masing-masing. Semasa peringkat akhir kehamilan, hanya placentum yang telah dikesan dan memberi 100% nilai ketepatan andaian. Ketepatan dalam mengandaikan status kebuntingan dan umur fetus bagi setiap peringkat adalah 100, 100, 97 dan 100%, masing-masing. Pengesanan awal untuk kebuntingan adalah menjanjikan dengan prob TR. Imej yang diambil membolehkan operator menentukan peringkat kebuntingan bagi meningkatkan keberkesanan pembiakbakaan. Prob TR lebih sesuai mengesan kebuntingan pada peringkat awal manakala prob TA lebih praktikal untuk kebuntingan peringkat akhir. Kedua-dua prob diperlukan bagi memastikan keberkesanan dalam diagnosis kehamilan ini. Oleh itu, teknologi pengesanan ultrabunyi boleh digandingkan dengan kaedah pembiakan teknologi yang lain e.g. pernian beradas dan penyejukbekuan untuk dijadikan rutin dan secara berkesan dalam pengurusan ladang kambing. Kesimpulannya, mesin ultrabunyi B-mode adalah berkesan dalam diagnosis kebuntingan kambing seawal 23 hari dan memberi nilai ketepatan andaian yang tinggi dalam menentukan peringkat-peringkat kebuntingan yang berbeza menggunakan kedua-dua prob.

ACKNOWLEDGEMENTS

I would like to express the highest gratitude and am entirely grateful to Allah, the Al-Mighty for giving me the strength throughout this challenging journey and successfully completed my study. I am also blessed to be around fantastic individuals that contributed a lot during my study and led to my MSc completion.

First and foremost, a million thanks to my supervisor, Prof Dr Wan Khadijah Wan Embong and my co-supervisor, Prof Dr Ramli bin Abdullah for being empathy and patience with me and taught me a great deal on how to be a successful researcher. Thank you for having such strong faith on how this study will benefit others in many ways and giving their threshold trust upon me to make it a triumphant. Thank you for spending your valuable hours assisting me in my thesis write-up. Thank you for your criticism, encouragements and enthusiasm in making my research a success. Their valuable assistance were tremendous and I am truly grateful for that. From the bottom of my heart, thank you.

My highest gratitude to PERDA, the Prime Minister Department for allowing me to conduct my research at KBKB, Penang. Thank you to the staff and workers who give their cooperation and aid in farm management and without which it might be a struggle for me to complete this study.

I would like to thank my colleagues at ABEL; Mrs. Nor Fadillah Awang, Mr. Parani Baya, Ms. Azieatul Ashikin Abdul Aziz, Mr. Mohd. Nizam Abd. Rashid, Ms. Kwong Phek Jin, Ms. Soh Hui Hui, Ms. Tan Wei Lun, Ms. Goh Siew Ying, Ms. Nor Farizah Abdul Hamid, Ms. Kong Sow Chan, Ms. Noor Azlina Kamaruding, Mr. Shahrulzaman Shahrudin and Ms. Asmad Kari for helping me during my experiments in KBKB Farm and ABEL lab. Thank you for sharing valuable informations and makes

ABEL a livelier place to work in. I am proud to say I metamorphed into a better researcher and individual throughout my study and research in ABEL. Thank you so much for that.

Nevertheless, I would like to thank University Malaya Fellowship (SLAB) and JPA for their sponsor throughout my study. In addition, thank you to IPPP for the generous research grant (Grant No; PS288/2008C) during these past few years. Other than that, I would like to thank Institute Science of Biology (ISB) in Science Faculty.

Last but not least, thanks to my family especially my father, Mr. Raja Khalif bin Raja Ismail for his tolerance and wisdom in supporting me throughout this impeccable journey. Thanks to my siblings who continuously remind me of what is important in life and my late mom for her endless care and love. I would also like to thank all individuals that were involved in this study. Thank you again.

Figure 4.78	Image (A) is an original image. Placentomes were detected on day 70 of gestation (middle stage). Image (B) is a labeled image	157
Figure 4.79	Image (A) is an original image. Foetus with heartbeat, spinal cord and ribs were detected on day 90 of gestation (late stage). Image (B) is a labeled image	158
Figure 4.80	Image (A) is an original image. Placentomes were detected on day 90 of gestation (late stage).Image (B) is a labeled image	159
Figure 4.81	Image (A) is an original image. Placentomes were detected on day 91 of gestation (late stage). Image (B) is a labeled image	160
Figure 4.82	Image (A) is an original image. Foetus with heartbeat, spinal cord and ribs were detected on day 91 of gestation (late stage).Image (B) is a labeled image	161
Figure 4.83	Image (A) is an original image. Foetus with heartbeat, spinal cord and ribs were detected on day 93 of gestation (late stage). Image (B) is a labeled image	162
Figure 4.84	Image (A) is an original image. Placentomes were detected on day 93 of gestation (late stage).Image (B) is a labeled image	163
Figure 4.85	Image (A) is an original image. Placentomes, foetus with heartbeat and foetal organ were detected on day 95 of gestation (late stage).Image (B) is a labeled image	164
Figure 4.86	Image (A) is an original image. Foetus with heartbeat, spinal cord, ribs and foetal organ were detected on day 98 of gestation (late stage).Image (B) is a labeled image	165
Figure 4.87	Image (A) is an original image. Placentomes were detected on day 98 of gestation (late stage).Image (B) is a labeled image	166
Figure 4.88	Image (A) is an original image. Foetus with heartbeat, spinal cord, ribs and foetal organ were detected on day 109 of gestation (late stage).Image (B) is a labeled image	167

Figure 4.89	Image (A) is an original image. Placentomes were detected on day 109 of gestation (late stage).Image (B) is a labeled image	168
Figure 4.90	Image (A) is an original image. Foetus with heartbeat, spinal cord, ribs and foetal organ were detected on day 98 of gestation (late stage). Image (B) is a labeled image	169
Figure 4.91	Image (A) is an original image. Placentomes were detected on day 98 of gestation (late stage).Image (B) is a labeled image	170
Figure 4.92	Image (A) is an original image. Foetus with heartbeat, spinal cord, ribs and foetal organ were detected on day 106 of gestation (late stage).Image (B) is a labeled image	171
Figure 4.93	Image (A) is an original image. Foetus with heartbeat, spinal cord and foetal organ were detected on day 106 of gestation (late stage).Image (B) is a labeled image	172
Figure 4.94	Image (A) is an original image. Foetus with heartbeat, spinal cord, ribs and foetal organ were detected on day 119 of gestation (late stage). Image (B) is a labeled image	173
Figure 4.95	Image (A) is an original image. Placentomes were detected on day 119 of gestation (late stage).Image (B) is labeled a image	174
Figure 4.96	Image (A) is an original image. Foetus with heartbeat were detected on day 111 of gestation (late stage). Image (B) is a labeled image	175
Figure 4.97	Image (A) is an original image. Foetus with heartbeat, spinal cord, ribs and foetal organ were detected on day 111 of gestation (late stage). Image (B) is a labeled image	176
Figure 4.98	Image (A) is an original image. Foetus with heartbeat, spinal cord and ribs were detected on day 97 of gestation (late stage). Image (B) is a labeled image	177
Figure 4.99	Image (A) is an original image. Foetus with heartbeat, spinal cord and ribs were detected on day 111 of gestation (late stage). Image (B) is a labeled image	178
Figure 4.100	Image (A) is an original image. Foetus with heartbeat, spinal cord, ribs and foetal organ were detected on day 111 of gestation (late stage). Image (B) is a labeled image	179
Figure 4.101	Image (A) is an original image. Foetus with heartbeat,	180

	spinal cord, ribs and foetal organ were detected on day 96 of gestation (late stage). Image (B) is a labeled image	
Figure 4.102	Image (A) is an original image. Foetus with heartbeat, spinal cord, ribs and foetal organ were detected on day 103 of gestation (late stage). Image (B) is a labeled image	181
Figure 4.103	Image (A) is an original image. Foetus with heartbeat, spinal cord, ribs and foetal organ were detected on day 101 of gestation (late stage). Image (B) is a labeled image	182
Figure 4.104	Image (A) is an original image. Placentomes were detected on day 137 of gestation (final stage). Image (B) is a labeled image	183
Figure 4.105	Image (A) is an original image. Placentomes were detected on day 143 of gestation (final stage). Image (B) is a labeled image	184

Appendix Figure

Appendix Figure 1.1	Image (A) is an original image of transrectal ultrasonography images of the uterine horns on a non-pregnant goat day 18 after mating in Anglo-Nubian goats. Note the absence of discrete non-echogenic areas in the uterine lumen cranial to the urinary bladder (b). Image (A1) is a labeled image	218
Appendix Figure 1.2	Image (B) is an original image transrectal ultrasonographic images of the uterine horns on day 18 after mating in Anglo-Nubian goats. Ultrasonography of the uterine horn in a pregnant goat showing a round non-echogenic area in the uterine lumen (arrow). Image (B1) is a labeled image	219
Appendix Figure 1.3	Image (C) is an original image transrectal ultrasonography images of the uterine horns on day 18 after mating in Anglo-Nubian goats. Image of the uterine horn in a pregnant goat showing an elongated non-echogenic area in the uterine lumen arrows. Image (C1) is a labeled image	220
Appendix Figure 1.4	Image (A) is an original image transrectal ultrasonography images of uterine horns in pregnant goats. Embryo (arrow) measuring 8 mm on day 23 after mating. Image (A1) is a labeled image	221

Appendix Figure 1.5	Image (B) is an original image transrectal ultrasonography images of uterine horns in pregnant goats. Embryo (arrow) on day 40 after mating. The embryo measures 36 mm from the crown to rump. Image (B1) is a labeled image	222
Appendix Figure 1.6	Image (A) is an original image. Ultrasound image of the urinary bladder (black sphere; arrow) in goats obtained using a 7.5 MHz transrectal transducer. Image (A1) is a labeled image	223
Appendix Figure 1.7	Image (A) is an original image. Ultrasound image of non-pregnant uterus in goats obtained using a 7.5 MHz transrectal transducer. The uterus appears as a spherical structure with a medium echogenic density. Image (A1) is a labeled image	224
Appendix Figure 1.8	Image (A) is an original image. Ultrasound image of early pregnant uterus using a 7.5 MHz transrectal transducer on day 21 post-mating (arrow). The fluid-filled sacs were round or oblong in shape. Image (A1) is a labeled image	225
Appendix Figure 1.9	Image (A) is an original image. Ultrasound images of a goat embryo on day 30 of gestation obtained using a 7.5 MHz transrectal transducer. The embryo (E, arrow) is observed as an area of high echoic density. Image (A1) is a labeled image	226
Appendix Figure 1.10	Image (A) is an original image. Ultrasound images of a goat embryo on day 35 of gestation obtained using a 7.5 MHz transrectal transducer. Image B shows the umbilical cord (arrow). Image (A1) is a labeled image	227
Appendix Figure 1.11	Image (A) is an original image. Typical images observed by transrectal real-time ultrasonography with a 7.5 MHz linear-array transducer. Uterus of a non-pregnant doe (visible as a fuzzy ellipsoid structure). Image (A1) is a labeled image	228
Appendix Figure 1.12	Image (A) is an original image. Typical images observed by transrectal real-time ultrasonography with a 7.5 MHz linear-array transducer. Fluid-filled vesicle in the uterine lumen of a doe 22 days pregnant. Image (A1) is a labeled image	229
Appendix Figure 1.13	Image (A) is an original image. Typical images observed by transrectal real-time ultrasonography with a 7.5 MHz linear-array transducer. Larger foetus (head to the left) and umbilical cord of a doe 34 days pregnant. Image (A1)	230

	is a labeled image	
Appendix Figure 1.14	Image (A) is an original image. Ultrasound images of twin pregnancy (arrows) on day 40 of gestation obtained using 5.0 MHz transabdominal transducer. Image (A1) is a labeled image	231
Appendix Figure 1.15	Image (A) is an original image. Ultrasound images of placentomes in goats (arrows) obtained on day 35 (A) using 7.5 MHz transrectal transducer. Image (A1) is a labeled image	232
Appendix Figure 1.16	Image (B) is an original image. Ultrasound images of placentomes in goats (arrows) obtained on day 60 (B) of gestation using 5.0 MHz transabdominal transducer (note that placentomes are visible as small nodules on day 35 and become C or O shape later and increased in size as in image (B). Image (B1) is a labeled image	233
Appendix Figure 1.17	Image (A) is an original image. Ultrasound images of the thorax in a goat foetus at 2 months of gestation obtained using a 5 MHz transabdominal transducer (arrows). Image (A1) is a labeled image	234
Appendix Figure 1.18	Image (A) is an original image. Ultrasound images of a long bone (radius; A) goat foetus on day 70 of gestation obtained using a 5 MHz transabdominal transducer. Image (A1) is labeled image	235
Appendix Figure 1.19	Image (B) is an original image. Ultrasound images of a head (B) of a goat foetus on day 70 of gestation obtained using a 5 MHz transabdominal transducer. Image (B1) is a labeled image	236
Appendix Figure 1.20	Image (A) is an original image showing a female foetus with 45 days of pregnancy showing tail (T) and genital tubercle (GT). The ultrasound frequency was 6.0 MHz for all the images	237
Appendix Figure 1.21	Image (B) is an original image showing a female foetus with 48 days of pregnancy showing genital tubercle (GT) and umbilical cord (UC). The ultrasound frequency was 6.0 MHz for all the images	237
Appendix Figure 1.22	Image (C) is an original image showing female foetus with 58 days of pregnancy showing vulva (V), umbilical cord (U) and the ultrasound frequency was 6.0 MHz for all the images	238

Appendix Figure 1.23	Image (D) is an original image showing male foetus with 60 days of pregnancy showing scrotal bag (SB). The ultrasound frequency was 6.0 MHz for all the images	238
Appendix Figure 1.24	Image (A) is an original image. Linear-array echographic images of the caprine foetus during the last three weeks of gestation. In all four instances the cranial part of the foetus is to the left, the caudal part to the right. The abdominal wall and uterine wall must be thought of as the base of each figure. A: thorax and anterior abdomen showing the foetal ribs, the heart, abomasum and the upper part of a frontleg Image (A1) is a labeled image	239
Appendix Figure 1.25	Image (A) is an original image. Linear-array echographic images of the caprine foetus during the last three weeks of gestation. In all four instances the cranial part of the foetus is to the left, the caudal part to the right. The abdominal wall and uterine wall must be thought of as the base of each figure. B: thorax and abdomen showing the heart, dorsal aorta, part of the foetal stomach and one of the kidneys. Image (A1) is a labeled image	240
Appendix Figure 1.26	Image (A) is an original image. Linear-array echographic images of the caprine foetus during the last three weeks of gestation. In all four instances the cranial part of the foetus is to the left, the caudal part to the right. The abdominal wall and uterine wall must be thought of as the base of each figure. C: caudal part of the abdomen showing the dorsal aorta and the two kidneys. Image (A1) is a labeled image	241
Appendix Figure 1.27	Image (A) is an original image. Linear-array echographic images of the caprine foetus during the last three weeks of gestation. In all four instances the cranial part of the foetus is to the left, the caudal part to the right. The abdominal wall and uterine wall must be thought of as the base of each figure. D: thorax and anterior abdomen showing the junction of the umbilical vein and the posterior vena cava (i.e. ductus venosus). Image (A1) is a labeled image	242

LIST OF TABLES

Table	Title	Page
Table 2.1	Timeline of significant findings in goat ultrasound imaging in goat reproduction	11
Table 2.2	Development of foetal structures detected in goats using transrectal and transabdominal probes with accuracy rate along gestation period	31
Table 3.1	Classification stages of gestation and probable probe suitability for pregnancy detection	43
Table 3.2	Independent and dependant variables	51
Table 4.1	Images of foetal and related structures during gestation period during 7.5 MHz transrectal probe	55
Table 4.2	Images of foetal and related structures during gestation period using 5.0 MHz transabdominal probe	65
Table 4.3	Images on indicators along pregnancy period (stage and day of pregnancy) using 7.5 MHz transrectal probe	78
Table 4.4	Summary of image observation for each structure/combination of structures using transrectal probe during gestation period	88
Table 4.5	Number of animals that tested positive and negative with different stage of gestation	92
Table 4.6	Images on indicators along pregnancy gestation using 5.0 MHz using transabdominal probe	95
Table 4.7	Image observation for each structure/combination of structures using transabdominal probe during early and middle stages of gestation	117
Table 4.8	Image observation for each structure/combinations of structures using transabdominal probe structures during late stage of gestation	119
Table 4.9	Image observation for each structure/combination of structures using transabdominal probe structures during final stage of gestation	121
Table 4.10	Number of animals that tested positive and negative with different stage of gestation	125

Table 4.11	Pregnancy predictive value (%) on specific and combinations of structures along gestation period using both probes	128
Table 4.12	Summary on percentage of predicted accuracy on pregnancy status and predicted day of foetus during early stages of gestation using 7.5 MHz transrectal probe	129
Table 4.13	Summary prediction and actual days of foetus with percent of accuracy on pregnancy status and predicted day during middle, late and final stages of gestation using 5.0 MHz transabdominal probe	130
Table 4.14	Accuracy value (%) on stages of pregnancy during early, middle, late and final stage of gestation	133

LIST OF ABBREVIATIONS

ABEL	Animal Biotechnology-Embryo Laboratory
CW	Continuous wave
CL	Corpora lutea
Heartbeat	Detection of heart in foetus
KBKB	Kambing Bakabaik Kapala Batas
NE	Non-echogenic
PW	Pulsed wave
TA	Transabdominal probe
TR	Transrectal probe
