

4.1 OVERVIEW OBSERVATION ON FOETAL DEVELOPMENT AND RELATED IMAGES IN REPRODUCTIVE SYSTEM IN DOES USING TRANSRECTAL PROBE (EXPERIMENT 1)

Using 7.5 MHz transrectal probe, the images of different structures indicating pregnancy from days 13 to 142 along gestation period were observed (Table 4.1). Sacs and non-echogenic (NE) areas were observed as early as days 13 to 25 of gestation (Figures 4.1-4.3). Foetus-heartbeat-uterine wall-amniotic fluid was detected as early as 28 days of gestation (Figure 4.4). Placentomes were observed on days 29 of gestation (Figure 4.5). No specific indicators were found using transrectal probe at later stages of pregnancy, i.e. on days 51 to 142 of gestation (Figures 4.6-4.8).

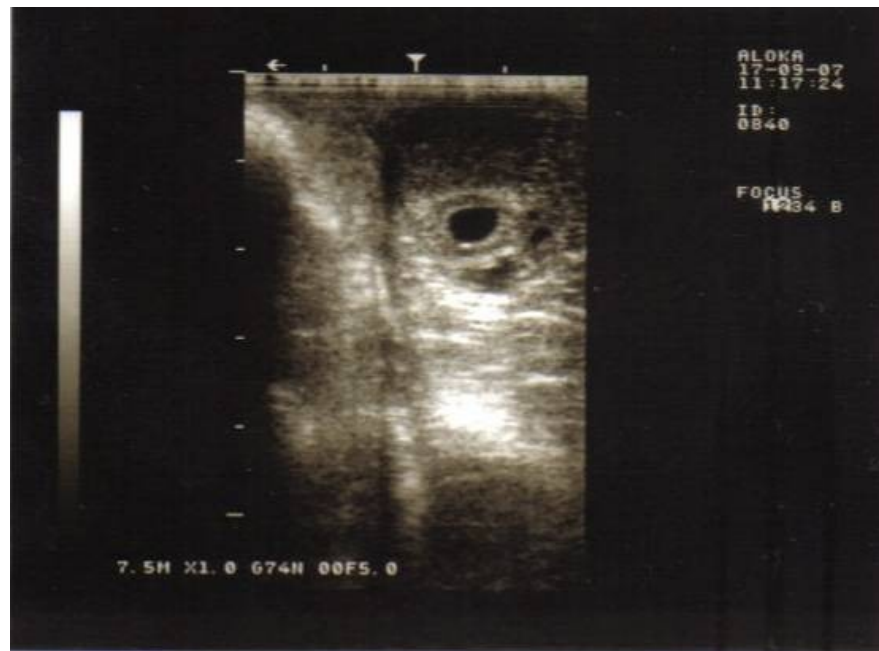

Table 4.1: Images of foetal and related structures during gestation period using 7.5 MHz transrectal probe

Day of pregnancy	Predicted pregnancy	Sac	Non-echogenic (NE) area*	Placentome	Foetus	Uterine wall	Amniotic fluid	Heartbeat
13	+	+	-	-	-	-	-	-
16	-	-	-	-	-	-	-	-

4.2 OVERVIEW OBSERVATION ON FOETAL DEVELOPMENT AND RELATED IMAGES IN REPRODUCTIVE SYSTEM IN DOES USING TRANSABDOMINAL PROBE (EXPERIMENT 2)

In this experiment, images of different structures were observed during later stages of pregnancy. Table 4.2 presents images of foetus along gestation period obtained from ultrasound scanning using 5.0 MHz transabdominal probe. The earliest indicator observed was placentomes which were detected as early as day 51 of gestation, i.e. during middle stage of pregnancy (Figure 4.9). In addition, foetus-placentomes images were detected on day 66 of pregnancy (Figures 4.10- 4.11). Other structures such as spinal cord were detected from day 70 of gestation (Figure 4.12). Images on days 108 and 117 (late stage of pregnancy) showed foetus-heartbeat-spinal cord-ribs-foetal organs (Figure 4.13). Placentomes were also observed on days 123 to 142 of gestation (Figures 4.14- 4.15). In contrast to the results obtained in Experiment 1 using the transrectal probe (Section 4.1), no specific image indicators were found using transabdominal probe at early stages of pregnancy, i.e. on days 13 to 30 of gestation (Figures 4.16-4.18).

4.3 OPTIMIZATION OF PREGNANCY DIAGNOSIS OF DOES USING TRANSRECTAL PROBE (EXPERIMENT 3)

Table 4.3 shows pregnancy indicators observed using 7.5 MHz transrectal probe along gestation period. Indicators were labeled alphabetically (i.e. each alphabet refers to individual doe) to ease separating each image captured on different does at the estimated day of gestation. The earliest sac was detected in a doe on day 16 of gestation. However, sacs were detected from days 21 to 27 of gestation in all other does involved in this experiment (Figure 4.19). Non-echogenic (NE) areas were also observed from days 20 to 24 of pregnancy (Figures 4.20-4.21). Placentomes were observed on day 30 of gestation (Figure 4.22). During early stage, combination of foetus-heartbeat-uterine wall-amniotic fluid was detected from days 26 to 44 of gestation (Figures 4.23-4.24). Foetus with heartbeat was detected on day 27 of gestation. There was no indicator or structure observed from day 54 onwards (Figure 4.25). Table 4.4 shows a summary of image observed for specific structure or combination of structures with number of does along gestation period. For early stage of pregnancy, pregnancy predictive value (percentage) for singular indicators, i.e. sac, non-echogenic (NE) area, placentomes, foetus, heartbeat, amniotic fluid and uterine wall were 15, 13, 2, 20, 20, 15 and 15%, respectively (Figure 4.26). Combination of foetus-heartbeat, foetus-heartbeat-uterine wall-amniotic fluid and singular indicators, i.e. sac, non-echogenic (NE) area and placentomes, the pregnancy predictive percent were 7, 31, 31, 27 and 4%, respectively (Figure 4.27). Frequency of singular structural images was observed along gestation period in Figure 4.28. Non-echogenic (NE) area occurrences were twice and 5 times on days 16-20 and 21-25 of gestation, respectively. Occurrences of sac were once, 6 times and twice on days 16-20, 21-25 and 26-31 of gestation, respectively. Occurrences for placentomes, foetus, heartbeat, amniotic fluid and uterine wall were once, 6 times, 6 times, 4 times and 4 times on days 26-31 of gestation, respectively. Foetus, heartbeat,

amniotic fluid and uterine wall each occurred 4 times on days 32-44 of gestation. Figure 4.29 shows frequency of selected structural images (singular and combination of structures) observed on early stage of gestation. Occurrences for NE area on days 16-25 was 7 times. Occurrences of sac on days 16-25 and 26-31 were 7 times and twice, respectively. Foetus-heartbeat occurred twice on days 26-31 of gestation. Occurrences of foetus-heartbeat-uterine wall-amniotic fluid were 4 times on days 26-31 and 32-44 of gestation, respectively. The sensitivity, specificity, positive predictive value, negative predictive value and overall accuracy with numbers of does along gestation period are shown in Table 4.5. The sensitivity, specificity, positive predictive value, negative predictive value and overall accuracy for initial stage were 100, 40, 25, 100 and 66%, respectively. Early stage of gestation gave 96, 100, 100, 80 and 94% of sensitivity, specificity, positive predictive value, negative predictive value and overall accuracy, respectively.

Table 4.3: Images on indicators along pregnancy period (stage and day of pregnancy) using 7.5 MHz transrectal probe

g: Positive predictive value (%)	25% (1/4)	100% (26/26)
h: Negative predictive value (%)	100% (2/2)	80% (4/5)
Overall accuracy (%)	66%	94%

Note:

- a: Pregnant does that were correctly diagnosed
- b: Pregnant does that were incorrectly diagnosed
- c: Non-pregnant does that were correctly diagnosed
- d: Non-pregnant does that were incorrectly diagnosed
- e: Sensitivity $[a/(a + d)]$
- f: Specificity $[c/(b + c)]$
- g: Positive predictive value $[a/(a + b)]$
- h: Negative predictive value $[c/(c + d)]$
- i : Overall accuracy $(e + f + g + h /4)$

^x refers to the confirmation of does whether kidding or not kidding

4.4 OPTIMIZATION OF PREGNANCY DIAGNOSIS OF DOES WITH TRANSABDOMINAL PROBE (EXPERIMENT 4)

Using transabdominal probe, the first indicator detected was placentomes on day 54 of gestation onwards. Combinations of structures, i.e. placentomes-foetus-heartbeat-spinal cord were detected as early as day 56 of gestation (Figures 4.32-4.35). Images of foetus-heartbeat were detected on day 67 of gestation (Figure 4.36). In Figures 4.37-4.39, foetus-heartbeat-placentomes-spinal cord images were detected on days 68 and 72 of gestation. Images of foetus-heartbeat-spinal cord were observed along the middle stage of pregnancy, i.e. on days 56 to 83 of pregnancy. In late stage, foetus-heartbeat-spinal cord-ribs-placentomes were detected from days 84 to 88 of gestation (Figures 4.40-4.43). Images with foetus-heartbeat-spinal cord-foetal organs were detected on days 103 to 119 (Figures 4.44-4.48). During final stage of gestation, placentomes was detected from days 120 to 146 of gestation (Figure 4.49). There was no indicator or structure observed in earlier pregnancy, i.e. on days 25 until 46 of gestation (Figure 4.50). Table 4.6 shows pregnancy indicators according to stages and days of pregnancy. Table 4.7 shows observation of structures using transabdominal probe for middle stage of gestation. Frequency of occurrence of each structure in middle stage, i.e. placentomes; foetus-heartbeat, placentomes-foetus-heartbeat and foetus-heartbeat-spinal cord and/or ribs were 4, 7, 5 and 5 times, respectively. Predictive values for placentomes, foetus-heartbeat, placentomes-foetus-heartbeat and foetus-heartbeat-spinal cord and/or ribs during middle stage were 19%, 33%, 24% and 24% (Figure 4.51). During late stage, occurrence of each structures and combinations i.e. placentomes, foetus-heartbeat, foetus-heartbeat-spinal cord-ribs, placentomes-foetus-heartbeat-spinal cord-ribs, foetus-heartbeat-spinal cord-ribs-foetal organ and placentomes-foetus-heartbeat-spinal cord-ribs-foetal organ were twice, thrice, thrice, 5, 7 and 8 times, respectively (Table 4.8). Figure 4.52 shows pregnancy predictive

for placentomes, foetus-heartbeat, foetus-heartbeat-spinal cord and/or ribs, placentomes-foetus-heartbeat-spinal cord and/or ribs, foetus-heartbeat-spinal cord and/or ribs-foetal organ and placentomes-foetus-heartbeat-spinal cord and/or ribs-foetal organ were 7, 10, 10, 19, 25 and 29%. In final stage (Table 4.9), placentomes and placentomes-foetus-heartbeat-spinal cord and/or ribs-foetal organ gave seven and once, respectively. Predictive values for placentomes and placentomes-foetus-heartbeat-spinal cord and/or ribs-foetal organ were 87.5 and 12.5%, respectively (Figure 4.53). Predictive value (percent) for each stages were summarized in Figure 4.54. Summary on frequency of singular and combination of structural images and were observed along gestation period in Figure 4.55. Number of does diagnosed with sensitivity, specificity, positive predictive value, negative predictive value and overall accuracy along gestation period are shown in Table 4.10. All animals were positively diagnosed and obtained 100% accuracy during initial, early, late and final stage of gestation. During middle stage of gestation, one doe was negatively diagnosed as pregnant and non-pregnant, respectively. Percentage of sensitivity, specificity, positive predictive value, negative predictive value and overall accuracy for middle stage is 95.5, 92 and 93.75, 97 and 98%, respectively.

Table 4.6: Images on indicators along pregnancy gestation using 5.0 MHz using transabdominal probe

Diagnoses ^x	Stage of gestation		
	Middle n=37	Late n=36	Final n=11
a: Correct positive	24	28	8
b: Incorrect positive	1	0	0
c: Correct negative	11	8	3
d: Incorrect negative	1	0	0
e: Sensitivity (%)	96%	100%	100%
	(24/25)	(28/28)	(8/8)
f: Specificity (%)	92%	100%	100%
	(11/12)	(8/8)	(3/3)
g: Positive predictive value (%)	96%	100%	100%
	(24/25)	(28/28)	(8/8)
h: Negative predictive value %)	92%	100%	100%
	(11/12)	(8/8)	(3/3)
Overall accuracy (%)	94%	100%	100%

Note:

a : Pregnant does that were correctly diagnosed

b : Pregnant does that were incorrectly diagnosed

c : Non-pregnant does that were correctly diagnosed

d : Non-pregnant does that were incorrectly diagnosed

e : Sensitivity $[a/(a + d)]$

f : Specificity $[c/(b + c)]$

g : Positive predictive value $[a/(a + b)]$

h : Negative predictive value $[c/(c + d)]$

i : Overall accuracy $(e + f + g + h /4)$

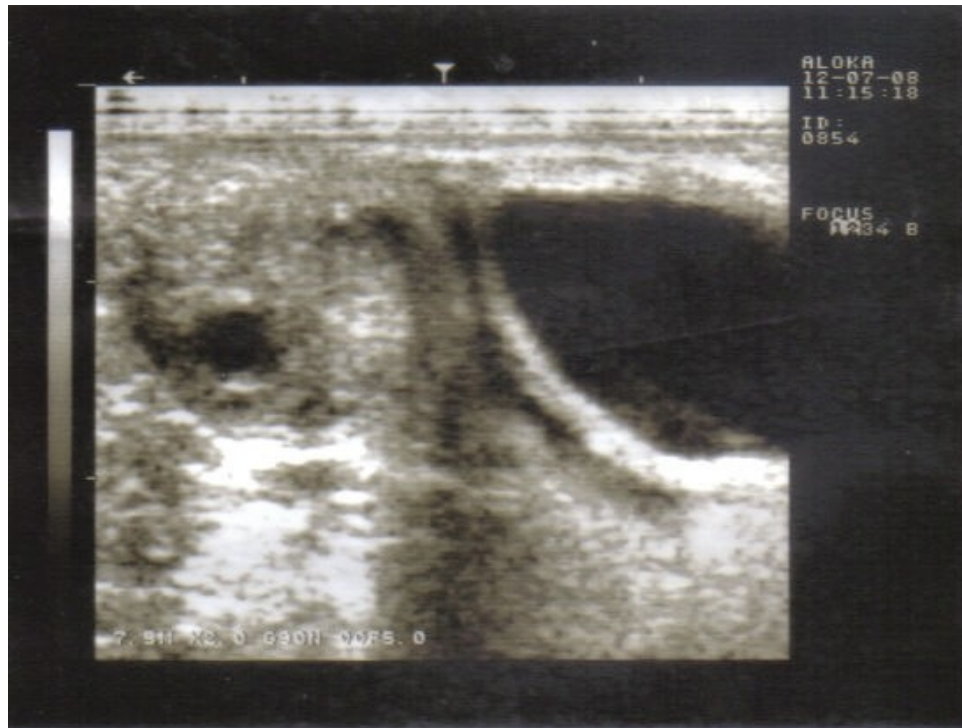

^x refers to the confirmation of does whether kidding or not kidding

4.5 PREGNANCY DIAGNOSIS IN DOES UNDERGO NATURAL MATING AND AI WITH TRANSRECTAL AND TRANSABDOMINAL PROBES

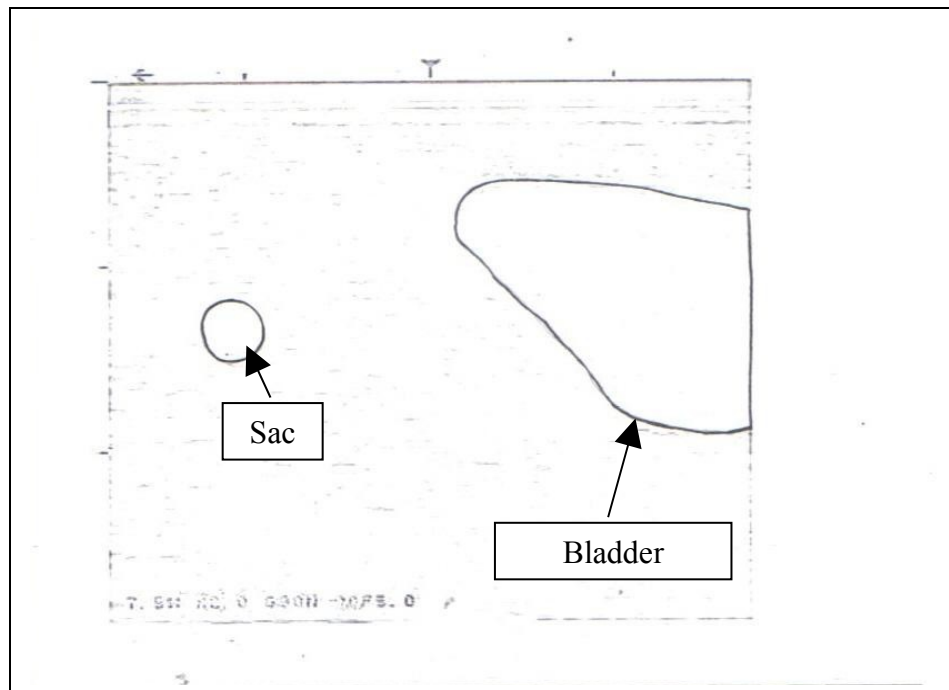

(EXPERIMENT 5)

In Experiment 5, a total of 75 does were used in the study. Table 4.11 shows prediction of specific and combinations of criteria obtained from Experiments 3 and 4 along pregnancy period. Specific and combinations of structures were initialized, i.e. E1, E2 and etc, for easier arrangements. Table 4.12 shows a summarized percentage of accuracy on pregnancy status and predicted day of gestation for 17 pregnant does using transrectal probe (based on kidding date). During early stage of pregnancy, a total of 13 and 4 does that undergo natural mating and AI were detected pregnant with combinations E1:sac (Figures 4.57-4.59), E2: non-echogenic (NE) area (Figures 4.60-4.62) and E3: foetus-uterine wall-amniotic fluid-heartbeat (Figures 4.63-4.66). Percent of accuracy for combinations of structures, i.e. E1, E2 and E3 gave 100% on days 21-28, 21-28 and 29-45 of gestation, respectively. During middle stage of pregnancy, combinations of structures, i.e. M1: foetus-heartbeat, M2: placentomes-foetus-heartbeat and M3: foetus-heartbeat-spinal cord-ribs (Figures 4.67-4.80) gave percent accuracy of 100% on range of days 50-71 and 72-83 of gestation for 12 pregnant does (8 does that underwent natural mating and 4 does with AI). A total of 15 and 4 does that underwent natural mating and AI were detected pregnant with different combinations L1: placentomes-foetus-heartbeat-spinal cord-ribs, L3: placentomes-foetus-heartbeat-spinal cord-ribs-foetal organ and L4: foetus-heartbeat-spinal cord-ribs-foetal organ (Figures 4.81-4.105) during late stage of gestation. Combination of structures i.e. L1, L2 and L3 gave 100%, 80% and 100% accuracy from days 84 to 119 of gestation. Two does were misdiagnosed on range of days 104-119 with L3 combination. During final stage of pregnancy, a total of 3 and 1

does that underwent natural mating and AI were detected pregnant with detection of placentomes (F2) in Figures 4.106 and 4.107. Detection of placentomes gave 100% accuracy on pregnant status and age prediction from days 121-146 of gestation. Figure 4.56 shows occurrence of significant indicators i.e. specific and combinations of structures along gestation period with transrectal and transabdominal probes. Structures on days 21-28 and 29-45 of gestation were sac (6 times) and non-echogenic (NE) area (5 times) and foetus-uterine wall-amniotic fluid-heartbeat (6 times), respectively. On days 60-71 of gestation, combinations of structures were foetus-heartbeat (thrice) placentomes-foetus-heartbeat (thrice) and foetus-heartbeat-spinal cord-ribs (once). On days 72-83 and 84-91 of gestation, combinations of structures were placentomes-foetus-heartbeat (4 times) and placentomes-foetus-heartbeat-spinal cord-ribs (3 times), respectively. Occurrences of combinations of structures detected on days 92-119 of gestation were 10 and 7 times for placentomes-foetus-heartbeat-spinal cord-ribs-foetal organ and foetus-heartbeat-spinal cord-ribs-foetal organ. On days 120-147 of gestation, occurrence for placentomes was 8 times. Table 4.17 shows accuracy values (%) for each combination on pregnant status and days of gestation using different probes. During early stage of gestation, accuracy was 100% for all combinations (E1, E2 and E3) using transrectal probe. All combinations during middle and final stages gave 100% accuracy. Combination during late stage for L1, L3 and L4 were 100%, 80% and 100% that gave 97% overall accuracy.

4.5 PREGNANCY DIAGNOSIS IN DOES UNDERGO NATURAL MATING AND AI WITH TRANSRECTAL AND TRANSABDOMINAL PROBE (EXPERIMENT 5)

In Experiment 5, a total of 75 does were used in the study. Table 4.14 shows prediction of specific and combinations of criteria obtained from Experiments 3 and 4 along pregnancy period. Specific and combinations of structures were initialized i.e. E1, E2 and etc, for easier arrangements. Table 4.15 shows summary on percentage of accuracy on pregnancy status and predicted day of gestation for 17 pregnant does using transrectal probe (based on kidding date). During early stage of pregnancy, a total of 13 and 4 does that undergo natural mating and AI were detected pregnant with combinations E1:sac (Figures 4.58-4.60), E2- non-echogenic (NE) area (Figures 4.61-4.63) and E3- foetus-uterine wall-amniotic fluid-heartbeat (Figures 4.64-4.67). Percent of accuracy for combinations of structures i.e. E1, E2 and E3 gave 100% on days 21-28, 21-28 and 29-45 of gestation, respectively. During middle stage of pregnancy, combinations of structures i.e. M1:foetus-heartbeat (Figure 4.68), M2-placentomes-foetus-heartbeat (Figures 4.69-4.78) and M3:foetus-heartbeat-spinal cord-ribs (Figures 4.79-4.81) gave percent accuracy of 100% on range of days 50-71 and 72-83 of gestation for 12 pregnant does (8 does that underwent natural mating and 4 does with AI). A total of 15 and 4 does that underwent natural mating and AI were detected pregnant with different combinations L1:placentomes-foetus-heartbeat-spinal cord-ribs (Figures 4.82-4.88), L3:placentomes-foetus-heartbeat-spinal cord-ribs-foetal organ (Figures 4.89-4.100) and L4: foetus-heartbeat-spinal cord-ribs-foetal organ (Figures 4.101-4.106) during late stage of gestation. Combination of structures i.e. L1, L2 and L3 gave 100%, 80% and 100% accuracy from days 84 to 119 of gestation. Two does were misdiagnosed on range of days 104-119 with L3 combination. During final stage of pregnancy, a total of 3 and 1 does that underwent natural mating and AI were detected pregnant with detection of placentomes (F2) in Figures 107 and 108. Detection of placentomes gave 100% accuracy on pregnant status and age

prediction from days 121-146 of gestation. Figure 4.58 shows occurrence of significant indicators i.e. specific and combinations of structures along gestation period with transrectal and transabdominal probes. Structures on days 21-28 and 29-45 of gestation were sac (6 times) and non-echogenic (NE) area (5 times); and foetus-uterine wall-amniotic fluid-heartbeat (6 times), respectively. On days 60-71 of gestation, combinations of structures were foetus-heartbeat (thrice); placentomes-foetus-heartbeat (thrice) and foetus-heartbeat-spinal cord-ribs (once). On days 72-83 and 84-91 of gestation, combinations of structures were placentomes-foetus-heartbeat (4 times) and placentomes-foetus-heartbeat-spinal cord-ribs (3 times), respectively. Occurrences of combinations of structures detected on days 92-119 of gestation were 10 and 7 times for placentomes-foetus-heartbeat-spinal cord-ribs-foetal organ and foetus-heartbeat-spinal cord-ribs-foetal organ. On days 120-147 of gestation, occurrence for placentomes was 8 times. Table 4.17 shows accuracy values (%) for each combination on pregnant status and days of gestation using different probes. During early stage of gestation, accuracy was 100% for all combinations (E1, E2 and E3) using transrectal probe. All combinations during middle and final stages gave 100% accuracy. Combination during late stage for L1, L3 and L4 were 100%, 80% and 100% that gave 97% overall accuracy.

Table 4.11: Pregnancy predictive value (%) on specific and combinations of structures along gestation period using both probes

Stage of pregnancy	Range of days (gestation days)	Specific/combination of structures	% prediction of stages of gestation ^a	Combination
Initial	16-20	Sac	25 (1/4)	E1
Early	21-28	Sac	44 (7/16)	E1
	21-28	Non-echogenic (NE) area	44 (7/16)	E2
	29-35	Foetus-uterine wall-amniotic fluid-heartbeat	83 (5/6)	E3
	36-45	Foetus-uterine wall-amniotic fluid-heartbeat	100 (5/5)	E3
Middle	60-71	Foetus-heartbeat	33 (4/12)	M1
		Placentomes-foetus-heartbeat	25 (3/12)	M2
		Foetus-heartbeat-spinal cord-ribs	25 (3/12)	M3
		Placentomes	17 (2/12)	M4
	72-83	Foetus x heartbeat	33 (3/9)	M1
		Placentomes-foetus-heartbeat	22 (2/9)	M2
		Foetus-heartbeat-spinal cord-ribs	22 (2/9)	M3
		Placentomes	22 (2/9)	M4
Late	84-91	Placentomes-foetus-heartbeat-spinal cord-ribs	25 (1/4)	L1
		Foetus-heartbeat-spinal cord-ribs	25 (1/4)	L2
	92-103	Placentomes-foetus-heartbeat-spinal cord-ribs-foetal organ	40 (4/10)	L3
		Foetus-heartbeat-spinal cord-ribs-foetal organ	20 (2/10)	L4
	104-111	Placentomes-foetus-heartbeat-spinal cord-ribs-foetal organ	60 (3/5)	L3
		Foetus-heartbeat-spinal cord-ribs-foetal organ	40 (2/5)	L4
	111-119	Placentomes-foetus-heartbeat-spinal cord-ribs-foetal organ	33 (3/9)	L3
		Foetus-heartbeat-spinal cord-ribs-foetal organ	44 (4/9)	L4
Final	120-131	Placentomes-foetus-heartbeat-spinal cord-ribs-foetal organ	12.5 (1/8)	F1
	133-147	Placentomes	87.5 (7/8)	F2

^a = number of does with specific structures upon total of doe during particular range of days

Table 4.12: Summary on percentage of predicted accuracy on pregnancy status and predicted day during early stage of gestation using 7.5 MHz transrectal probe
