## ABSTRACT

Hydrogenated silicon nitride alloy SiNH thin film has been grown on silicon and glass substrate from a DC plasma glow discharge decomposition of silane ( $\text{SiH}_4$ ) and ammonia ( $\text{NH}_3$ ) mixture, utilizing a home-built parallel-plate radial flow system. The properties of these films have been investigated using the Fourier Transform Infrared (FTIR) Spectroscopy and Ultraviolet-Visible transmission spectrum as a function of deposition parameters, namely  $\text{NH}_3$  to  $\text{SiH}_4$  flowrate ratio  $R=[\text{NH}_3]/[\text{SiH}_4]$  and substrate temperature. IR absorption revealed the incorporation of nitrogen into the Si-matrix through the broad Si-N stretching mode vibration in the region 700 to 1000  $\text{cm}^{-1}$  and centred around 860  $\text{cm}^{-1}$ . A closer analysis yields 5 components underlying the broad band, reproduced by superposition of Gaussian profiles using the least - squares method. Two different bonding environment for Si-N stretching absorption modes are observed at around 860  $\text{cm}^{-1}$  and 960  $\text{cm}^{-1}$  respectively. The presence of H has been readily observed in the vicinity of 2100  $\text{cm}^{-1}$  and 3500  $\text{cm}^{-1}$ , attributed to the Si-H and N-H stretching modes respectively. An appreciable oxygen content is detected through the Si-O stretching absorption around 1000  $\text{cm}^{-1}$ . The film compositional mole ratio  $x = \text{N/Si}$  is estimated from a quadratic dependence of the optical energy gap,  $E_g$  on the concentration of the incorporated N, and  $x$  values obtained ranging from zero to 0.88. A strong correlation between N/Si ratio,  $x$  and the  $\text{NH}_3$  to  $\text{SiH}_4$  flowrate ratio,  $R$  is observed, in the experimental regime, of the form  $x=\text{CR}^3$ .  $E_g$  increases smoothly from 2.03 eV towards 3.02 eV when the  $\text{NH}_3$  to  $\text{SiH}_4$  flowrate ratio is increased from zero towards 5. Whereas with increasing substrate temperature a gradual shift to lower  $E_g$  value is observed, from 3.66 eV to 2.71 eV. Hydrogen content seemed to have an influence on  $E_g$ . The static refractive index  $n_0$  displayed a decreasing trend when the  $\text{NH}_3$  to  $\text{SiH}_4$  flowrate ratio is increased while a reversal trend is displayed as the substrate temperature is increased. The average deposition rate of the films were relatively low as expected from a DC-induced field plasma decomposition. The variation of the average deposition rate as a function of  $\text{NH}_3$  to  $\text{SiH}_4$  flowrate ratio does not show a constant trend. A decrease in the average deposition rate with increasing substrate temperature is observed.

## ABSTRAK

Aloi filem nipis *silicon nitride* terhidrogen SiNH telah disediakan di atas substrat silikon dan kaca melalui kaedah Penguraian Nyahcas Berbara Arus Terus daripada campuran gas-gas *silane* ( $\text{SiH}_4$ ) dan ammonia ( $\text{NH}_3$ ), dengan menggunakan sistem plat selari aliran sepusat buatan sendiri. Filem nipis ini telah dicirikan dengan menggunakan Spektroskopi Transformasi Fourier Infra-Merah dan Spektrum Ketelusan Ultra-Lembayung, berfungisikan parameter penyediaan sampel iaitu nisbah kadar aliran gas *silane* terhadap gas ammonia  $R=[\text{NH}_3]/[\text{SiH}_4]$  dan suhu substrat. Kehadiran unsur nitrogen di dalam matrik silikon disahkan melalui penyerapan Infra-merah yang dominan di lingkungan 700 ke 1000  $\text{cm}^{-1}$  dan berpusat sekitar 860  $\text{cm}^{-1}$ , yang disebabkan oleh ikatan teregang Si-N. Kajian yang lebih terperinci menggunakan kaedah gandadua terkecil ke atas Taburan *Gaussian*, menunjukkan kawasan serapan yang dominan ini adalah hasil daripada pertindihan 5 komponen. Didapati terdapat 2 jenis ikatan teregang Si-N dengan sekitaran setempat yang berbeza dengan puncak-puncak serapan pada 860  $\text{cm}^{-1}$  dan 960  $\text{cm}^{-1}$ . Kehadiran unsur hidrogen dikesan melalui puncak serapan pada 2100  $\text{cm}^{-1}$  yang disebabkan oleh ikatan teregang Si-H dan puncak serapan di 3500  $\text{cm}^{-1}$  yang disebabkan oleh ikatan teregang N-H. Kandungan oksigen juga dikesan melalui puncak serapan di sekitar 1000  $\text{cm}^{-1}$ . Nisbah komposisi mol sampel  $x=\text{N}/\text{Si}$  telah dianggarkan melalui hubungan kuadratik di antara jurang tenaga optik  $E_g$  bahan dan nisbah kandungan unsur nitrogen  $x$ , dan nilai  $x$  didapati berubah daripada sifar ke 0.88. Nisbah N/Si juga diperhatikan jelas bergantung dengan nisbah kadar aliran gas R melalui hubungan  $x=\text{CR}^a$ . Nilai  $E_g$  bertambah secara berterusan daripada 2.03 eV kepada 3.02 eV apabila nisbah kadar aliran gas bertambah. Manakala dengan penambahan suhu substrat, nilai  $E_g$  beransur-ansur menurun daripada 3.66 eV ke 2.71 eV. Kandungan hidrogen di dalam sampel dipercayai berperanan melebarkan nilai  $E_g$ . Nilai indeks biasan statik  $n_0$  pula menunjukkan pola menurun dengan penambahan nisbah kadar aliran gas R dan menunjukkan pola menaik dengan penambahan suhu substrat. Secara relatif kadar purata pemendapan filem nipis ini adalah rendah sebagaimana yang telah dijangka bagi penguraian plasma dalam medan arus terus. Kadar purata pemendapan filem nipis ini tidak berubah secara seragam dengan nisbah kadar aliran gas  $\text{NH}_3$  terhadap  $\text{SiH}_4$ . Walaubagaimanapun dengan peningkatan suhu substrat kadar purata pemendapan filem nipis didapati menurun.

## ACKNOWLEDGEMENT

I would first like to express my appreciation to the University of Malaya for providing the opportunity and environment in which I could complete my dissertation. I am grateful to Yayasan Pok Rafeah for the scholarship awarded to me. I have benefited significantly and very much indebted from discussions, guidance and suggestions made by my supervisors; Dr Saadah binti Abdul Rahman, Dr Rahim bin Salam and Dr Harith bin Ahmad. I am further indebted to En. Mohamad bin Aruf, En. Khairul Annuar bin Abdul Karim and En. Zainal bin Aris for their technical assistance. For Faiz bin Abd. Rahman, Sangar Subramaniam, Saifollah bin Abdullah, Izdihar bin Ishak, Sharuddin bin Omar Baki and to all Solid State Physics postgraduate students, thanks for your support and I wish all the best to all of you. Last but not least, I am grateful to all Solid State Laboratory staff, in particular to Ramli bin Awang Mohamed, Saedah bte Harun and Che Fadzilah bte Abu Bakar, and to all Physics Department staff in general.
