ORIGINAL LITERARY WORK DECLARATION

Name of Candidate: Siti Suhana binti Sulaiman (I.C.: 830403-01-5286)

Registration / Matric No.: SGF 070022

Name of Degree: Master of Biotechnology (coursework + dissertation)

Title of Dissertation ("this Work"): Response surface optimization of crystal violet decolorization by pellets of *Pycnoporus sanguineus*

Field of Study: Biotechnology

I do solemnly and sincerely declare that:

- (1) I am the sole author/writer of this Work;
- (2) This Work is original;
- (3) Any use of any work in which copyright exists was done by way of fair dealing and for permitted purposes and any excerpt or extract from, or reference to or reproduction of any copyright work has been disclosed expressly and sufficiently and the title of the Work and its authorship have been acknowledged in this work;
- (4) I do not have any actual knowledge nor I ought reasonably to know that the making of this work constitutes an infringement of any copyright work;
- (5) I hereby assign all and every rights in the copyright to this Work to the University of Malaya ("UM"), who henceforth shall be owner of the copyright in this Work and that any reproduction or use in any form or by any means whatever is prohibited without the written consent of UM having been first had and obtained;
- (6) I hereby declare that the Work is based on my original work except for quotations and citation which have been duly acknowledged;
- (7) I also declare that it has not been previously or concurrently submitted for any other degree at UM or other institutions.

ABSTRACT

Ligninolytic enzymes of white-rot fungi have broad specificities and have been implicated in transformation and mineralization of organo-pollutant with chemical structure similar to lignin e.g. synthetic dyes. This study was carried out to optimize selected parameters for decolorization of Crystal violet by *Pycnoporus sanguineus* in shake flasks. The parameters studied were initial dye concentration (ppm), agitation speed (rpm) and process time. They were optimized using response surface methodology (RSM). Subsequent to the optimization, the decolorization process was scaled up in stirred tank reactor (STR). Effect of different geometry of impellers on the decolorization process was studied. Curved blade and angled blade 60° impellers were used in the STR. Statistical analysis showed that initial dye concentration and decolorization time have significant effect exerted on the dye decolorization process ($p < 0.05$). Optimum condition for crystal violet decolorization was 40 ppm of initial dye concentration, two days process time and 160 rpm of agitation speed. In the STR, when curved blade impeller was used, increasing its rotational speed will increase the percentage of decolorization. On the contrary, when angled blade 60° impeller was used, the percentage of decolorization decreases with the increase in rotational speed of the impeller.

ABSTRAK

Enzim ligninolitik daripada kulat pereput putih mempunyai pengkhususan yang meluas dan mampu memberi impak di dalam penukaran dan mineralisasi pencemaran organik di mana ianya mempunyai struktur kimia yang serupa dengan lignin, contohnya; pewarna sintetik. Kajian ini dijalankan untuk mendapatkan parameter yang optimum bagi penyahwarnaan pewarna “crystal violet” oleh *Pycnoporus sanguineus*. Parameter yang terlibat termasuk kepekatan pewarna (ppm), kelajuan pengemparan (rpm) dan tempoh penyahwarnaan (h). Proses pengoptimuman dijalankan menggunakan “response surface methodology” (RSM). Selepas proses pengoptimuman dijalankan, Kajian diteruskan dengan skala yang lebih besar menggunakan tangki pengaduk. Kesan geometri pengaduk yang berbeza di dalam proses ini dikaji. Pengaduk yang digunakan di dalam tangki pengaduk adalah pengaduk mata melengkung dan pengaduk mata bersudut 60°. Analisis statistik menunjukkan kepekatan pewarna dan masa penyahwarnaan mempunyai pengaruh yang signifikan terhadap proses penyahwarnaan ($p < 0.05$). Keadaan optimum bagi proses penyahwarnaan “Crystal violet” adalah pada 40 ppm kepekatan awal pewarna, 2 hari tempoh pemprosesan dan 160 rpm kelajuan emparan. Bagi kajian berskala besar dengan menggunakan pengaduk mata melengkung, kenaikan laju pengaduk akan meningkatkan peratus penyahwarnaan. Sebaliknya, penggunaan pengaduk berpaksi ke bawah, peratus penyahwarnaan menurun dengan penambahan kelajuan pengaduk.

ACKNOWLEDGEMENTS

I would like to thank to whom much tribute for the success of this thesis, my supervisors Prof. Dr. Shaliza bt Ibrahim and Dr. M. Suffian b. M. Annuar who has offered precious information, suggestions, comments and guidance while carrying out this study.

I would also like to express my sincere gratitude to Mr. Alimin, Mr. Naziz, Ms. Atiqah and Ms. Liza Ferina for the help and support especially during the laboratory work and gaining information for this thesis.

Finally, I am deeply grateful to my husband, Mr. Farhan bin Hanaffi, and lovely parents, Mr. Sulaiman bin Jamin and Ms. Alimah binti Tauhid. They are the person who always give me encouragement, motivation and boundless of support. Thank you also for all my brothers, M. Dom, M. Rani and M. Shahir.
