*Wife and Daughter*

## ACKNOWLEDGEMENTS

I would like to express my deepest appreciation to the following persons who have directly and indirectly contribute to the success of my project and my academic study as a whole:-

1. Prof. Dr. Agamuthu Pariatamby, who has been my project supervisor for his inspiring guidance and continuous encouragement during this study.
2. My lecturers, who I have deep respect for their guidance and knowledge.
3. Pn. Norhayati Abd. Rahim (Manjung Municipality).
4. Cik Siti Nurhayati Hashim (Tioman Development Authority).
5. Tuan Hj. Rahman (Kuala Terengganu Municipality).
6. En. Vikneswaran (Langkawi Development Authority).
7. Dr. Shanmugam (Chemvi Laboratory Sdn Bhd).
8. All the Solid and Hazardous Waste Laboratory members who helped me a lot in sampling and laboratory analysis works.
9. All my fellow friends who work together with me, give moral support and assistance all the time.

Last but not least, I would like to thank God for giving me will and strength to accomplish this dissertation. May my work glorify His Name.

# UNIVERSITI MALAYA

## ORIGINAL LITERARY WORK DECLARATION

Name of Candidate: NAGENDRAN PERIAIAH (I.C/Passport No: 811122-10-5599)

Registration/Matric No: HGD030023

Name of Degree: MASTER OF TECHNOLOGY (ENVIRONMENTAL MANAGEMENT)

Title of Project Paper/Research Report/Dissertation/Thesis ("this Work"):

MUNICIPAL SOLID WASTE MANAGEMENT IN SELECTED MALAYSIAN ISLANDS

Field of Study: WASTE MANAGEMENT

I do solemnly and sincerely declare that:

- (1) I am the sole author/writer of this Work;
- (2) This Work is original;
- (3) Any use of any work in which copyright exists was done by way of fair dealing and for permitted purposes and any excerpt or extract from, or reference to or reproduction of any copyright work has been disclosed expressly and sufficiently and the title of the Work and its authorship have been acknowledged in this Work;
- (4) I do not have any actual knowledge nor do I ought reasonably to know that the making of this work constitutes an infringement of any copyright work;
- (5) I hereby assign all and every rights in the copyright to this Work to the University of Malaya ("UM"), who henceforth shall be owner of the copyright in this Work and that any reproduction or use in any form or by any means whatsoever is prohibited without the written consent of UM having been first had and obtained;
- (6) I am fully aware that if in the course of making this Work I have infringed any copyright whether intentionally or otherwise, I may be subject to legal action or any other action as may be determined by UM.

## ABSTRACT

Rapid developments and tourism related activities in Islands have increased the per capita waste generation that led to increased waste disposal at landfill. To date, islands in Malaysia are generating approximately 400 metric tons of MSW. Approximately 60% of the waste are collected and disposed off in non-sanitary landfills. The remaining 35 % were illegally burned/ dumped and 5 % were dumped into ocean. 100% of landfills in Malaysian islands operate as mere open-dumps that lack proper lining system and without leachate treatment facilities. The vicinities bordering non-sanitary landfill sites became highly polluted due to certain harmful gases/ leachate generated from waste filled surface and hazardous chemicals. This had triggered a serious environmental health and safety problems to the citizens as well as that of the tourist. Information on the quantity and quality of solid waste generated is fundamental to almost all aspects of MSW management. To date, data on MSW management in Malaysian islands are lacking and requires serious attention. This project presents and discuss waste generation, composition, characterization and current waste management practices in four tourist islands namely Redang, Tioman, Pangkor and Langkawi. MSW samples were collected everyday for seven continuous days (Monday – Sunday) and segregated by manual sorting into individual waste components at each island. Segregated samples were composited and brought to the laboratory, and analyzed for proximate, ultimate and calorific value. Surveys were conducted to gather information on current waste management practices and effectiveness. The MSW generation rate for islands was in the range of 0.5 – 1.1 kg/person/day. Different socio-economic development and the degree of urbanization influenced waste generation rates in the islands. Among the four islands studied, Langkawi (urban island) has the highest waste generation and better waste management in place. While, Redang (rural island)

generates less waste and showed poor waste management. Redang do not have any waste disposal site in the Island and transported the MSW to mainland for disposal. Poor waste collection and interruption of MSW transportation service to mainland during the monsoon season were identified as major MSW management problem. The waste composition results indicate that food waste as the main waste component with 31.8 %, followed by paper (21.0 %) and plastic (14.3%). Since island MSW has equally 42.5 % compostable and 42.5 % recyclables in the waste stream, composting can be incorporated at all the landfills together with an integrated system of recycling. Study indicate that if MSW separated at source and treated in integrated approach of the municipal wastes generated in the island, almost 85 % of the waste can be diverted from the landfill. Island MSW has high moisture content of 69 ( $\pm 7$ ) % and very low calorific value of 2501 ( $\pm 193$ ) kcal/kg which was not cost-effective for incineration and energy recovery. These explained the failure of six units of mini-incinerator with a capacity of 3 to 20 metric ton/day with an overall cost of RM 17 million (US 4.6 million) in the Islands. MSW management in Malaysian Islands is still at an infant stage and challenges encountered were aesthetically displeasing sites, inefficient waste collection/transportation, improper waste disposal method, marine pollution and lack of public awareness. These issues were discussed and suggestions made.
