## PREFACE

This thesis was prepared as one of the requirements for the Ph.D. Degree as well as a contribution to the formulation of the Paya Indah Water Resources Management Plan. The study has been carried out from March 2006 to December 2008. The Paya Indah Wetland Sanctuary with its ex-mining ponds at the southern portion and peat swamp forest at the northern portion may act as natural flood detention storage and therefore it is essential to understand the complex water balance of this wetland.

The research focused on the mathematical modelling approach to model the hydrology and the water balance of the Paya Indah wetland and the surrounding peat swamp forest. The mathematical model is based on the integrated hydrological modeling system, MIKE SHE.

This modeling system is particularly suited for wetland modeling because of its integration nature and the ability to count for both surface and subsurface flows and their interactions. Current and future researches will undoubtedly improve understanding of the basic concepts involved in this modelling project and may lead to more sophisticated flow and/or transport modelling(s).

The modelling protocol and related procedures in this thesis are therefore validated and aimed to be used as a management tool, thus the model subject to continuous refinement as new data become available and new questions arise.

This Ph.D. thesis contributes to the literature via participation in different national and international conferences; and publication in a few journals. Selective papers may include:

## ACKNOWLEDGEMENTS

The production of this thesis was made possible by the complementary funding from two different bodies including the Malaysian Ministry of Sciences, Technology & Environment under IRPA grant No. 02-03-08-003-EA003 and the University of Malaya under the Fellowship Scheme. Thanks are extended to the Department of Geology, Faculty of Science, and University of Malaya for all the provided facilities and assistance.

My sincerest thanks are due to my Advisor Assoc. Prof. Dr. Ismail Yusoff for his constant guidance and encouragement throughout the study period. The author duly appreciates the cooperation and support of Hj. Mr. Azmi M. Jaffri the Head of Department of Drainage and Irrigation Department (DID) of Malaysia; Dr. Zainudin Othman from the Malaysian Nuclear Agency.

Special gratefulness and appreciation are due to the helpfulness and gentleness of Mr. Salim from Drainage and Irrigation Department of Malaysia; Mr. Yagambaram V. (Baram) from Minerals and Geoscience Department of Malaysia/Selangor State Office; and Mr Ahamed Zaki from Malaysia Meteorological Department. I am also thankful Brother Mohammed who kindly and generously rescued the flow of work of this research project (Appendix K; Photo K.8).

I am so grateful for Ir. Miss Azizah Abdul Gadir and Ir. Mrs. Atikah Shafae from Drainage and Irrigation Department of Malaysia for their special treatment. A sincere gratitude is extended also to all the staff of Department of Geology of University of Malaya, Drainage and Irrigation Department of Malaysia and Minerals and Geoscience Department of Malaysia.

My final and special gratefulness and appreciation are due to my parents, sisters and brothers for their putting up with me and being patient all this while.

## ABSTRACT

MIKE SHE modelling system was used to simulate the surface and subsurface flow interactions at the Paya Indah wetland catchment which covers an area of 242.21 km<sup>2</sup> and lies in Selangor State in west of Malaysian peninsular. The watershed hydrology has been changed considerably due to the increased anthropogenic activities, producing different hydro-ecological problems for the catchment. These include frequent peat forest fires and dropping of the surface water level in the Paya Indah lakes system. Being physically-based distributed hydrologic model, the MIKE SHE model set-up, therefore, requires a vast set of input data which precisely include rainfall, evapotranspiration, river cross-section, detailed soil hydraulic properties and aquifer characteristics. The model was calibrated and validated against three targets including surface water, channel flow and groundwater head. The multi-criteria evaluation and hydrographs visual judgments revealed that the model performance was satisfactory which allowed running the water balance and assessing the impact of the predicted future scenarios. Results revealed that elevated rate of the evapotranspiration losses and the landuse change impacts considerably influence the water level in the Paya Indah lakes system at rechargeable area of peat cover. On contrast during both calibration and validation periods it was found that groundwater abstraction controlled the dynamics of the groundwater within a large zone covered most of the downstream area of the catchment. The impact of over-abstraction at the Megasteel Co. Ltd. property on surface water level of the Paya Indah lakes system was investigated. It was found that the exchangeable flow between unsaturated zone and saturated is very limited at the area of the lakes system due to occurrence of impermeable clay layer of 10 m – 15 m thick and of a low permeability of an average value of 4.8E-7 m/s which acts as barrier that controls exchangeable flow between the unsaturated and saturated zones at this part of the catchment. Nonetheless, it was found that the current rate of pumping had influenced the groundwater table to drop as low as ~ 4.0 m below sea level within the influenced zone of the Megasteel pumping wells which in turn, may rise up the potentiality of seawater intrusion and deep aquifer collapse. Looking at the overall water balance it is clear that evapotranspiration accounted for the largest water loss of ~ 60 % of the total rainfall. The model was slightly underestimated the total water balances by 0.45 % and 0.21 % the total rainfall for the calibration and validation periods respectively. Hydrological scenarios that likely might alter the quantity and timing of water exiting the Paya Indah wetland catchment were simulated with the validated model (baseline scenario) in order to evaluate their impacts on the watershed's hydrology. In this context, decreasing of the North-Inlet-Canal (SWL1) inflow as a result of launching the flood mitigation new channel that diverts Cyberjaya water towards Klang River Basin is one of the expected impacts of the full development of the adjacent Cyberjaya City and E-village. While as the results revealed that the deep aquifer might deplete partially or totally depending on the quantity of the groundwater withdrawal.

**PEMODELAN NUMERIKAL INTERAKSI ALIRAN PERMUKAAN DAN SUB-  
PERMUKAAN DI TANAH LEMBAB PAYA INDAH, SELANGOR D.E.,  
MALAYSIA**

**ABSTRAK**

Sistem pemodelan MIKE SHE telah digunakan untuk mensimulasi interaksi aliran air permukaan dan sub-permukaan di lembangan tanah lembab Paya Indah yang merangkumi kawasan seluas 242.21 km<sup>2</sup> yang terletak di Negeri Selangor, di barat Semenanjung Malaysia. Hidrologi lembangan ini telah berubah secara ketara akibat peningkatan aktiviti antropogenik yang menyumbang kepada masalah hidro-ekologi lembangan. Ini termasuklah kekerapan kebakaran hutan paya bakau dan kejatuhan paras air di sistem tasik-tasik Paya Indah. MIKE SHE merupakan model hidrologi dasaran fizikal yang memerlukan pemasukan data yang banyak yang diantaranya termasuklah data kerpasan, evapotranspirasi, keratan rentas sungai, sifat hidraulik tanah dan ciri-ciri akuifer. Model ini telah dikalibrasi dan divalidasi dengan tiga sasaran kalibrasi termasuklah aras air permukaan, saluran dan air tanah. Penilaian yang dibuat menggunakan multi-kriteria dan pengvisualan hidrograf menunjukkan kebolehan model ini adalah memuaskan dan membolehkan kajian keseimbangan air dan kesan senario masa depan diramalkan. Hasil kajian ini menunjukkan peningkatan kadar kehilangan air secara evapotranspirasi dan perubahan guna tanah memberi perubahan ketara kepada aras air di dalam sistem tasik Paya Indah di kawasan imbuhan yang ditutupi oleh tanah gambut. Secara perbandingannya pula, sepanjang tempoh masa kalibrasi dan validasi adalah didapati pengambilan air tanah yang mengawal dinamik air tanah di dalam zon luas yang merangkumi sebahagian besar kawasan hilir lembangan. Kesan pengambilan air tanah secara ketara oleh Syarikat MegaSteel Sdn. Bhd kepada aras air di tasik-tasik Paya Indah juga dikaji. Adalah didapati aliran yang bertukarganti di antara zon tak tepu dan zon tepu amat terhad bagi kawasan tasik dimana terdapatnya lapisan lempung tak telap yang berketebalan antara 10 m-15 m dengan kadar ketelapan yang rendah dengan nilai puratanya adalah 4.8E-7 m/s yang juga bertindak sebagai penghalang kepada aliran tukarganti di antara zon tak tepu dan zon tepu di sebahagian lembangan ini. Apapun adalah didapati kadar pengepaman air tanah pada masa ini telah menyebabkan aras air tanah jatuh sedalam 4.0 m di bawah paras laut bagi kawasan yang dipengaruhi oleh telaga pengepaman Megasteel yang berpotensi besar menjadi penyebab kepada intrusi air laut dan kegagalan akuifer dalam. Berdasarkan keseimbangan air secara keseluruhan adalah jelas didapati evapotranspirasi menjadi penyumbang besar kepada kehilangan air lembangan sehingga mencapai 60 % dari keseluruhan kerpasan. Model ini memberi kurangan anggaran keseimbangan air semasa proses kalibrasi dan validasi masing-masing sebanyak 0.45% dan 0.21 % dari jumlah hujan keseluruhan. Model yang telah divalidasi digunakan untuk melihat senario hidrologi yang bakal mengubah kuantiti dan masa kedapatan air di lembangan tanah lembab Paya Indah bagi menilai kesan perubahan kepada tindakbalas hidrologi lembangan. Bagi konteks ini, pembangunan sepenuhnya kawasan Bandar Cyberjaya dan E-Village yang bersebelahan dengan model lembangan akan menyebabkan terbentuknya saluran pemulihan baru yang mengalihkan aliran air dari Cyberjaya ke lembangan Sg. Klang dan menghilangkan kemasukan air dari saluran North-Inlet (SWL1). Disamping itu, keputusan pemodelan menunjukkan akuifer dalam mungkin mengalami kejatuhan secara separa atau keseluruhan bergantung kepada kuantiti pengeluaran air tanah.

5.4	Evaluation of the Predictive Accuracy of the Validated Model	157
5.5	Model Parameters and Statistical Evaluation of Each Calibration and Validation Simulation Run	160
5.6	Sensitivity of Different Flow Rate Modifications at SWL1	166
6.1	Water Balance Estimation at the Paya Indah Wetland Catchment: Contribution of each Component	173
7.1	Impacts of Groundwater Over-abstraction Scenarios	195
A.1	Criteria for the Designation of Wetland of International Importance	220
C.1	Coefficients of the Fitted IDF Equation for Kuala Lumpur	227
C.2	Rainfall Intensity-duration-frequency (IDF) Estimation for the	231

### Paya Indah Wetland Catchment

D.1	Monthly Rainfall at for the Paya Indah Wetland Catchment	232
E.1	Monthly Evapotranspiration at for the Paya Indah Wetland Catchment	233
F.1	Dimensions and Basic Statistics for the Cross sections of the River Network for the Modelled catchment	234
G.1	Malaysian Soil Series	237
H.1	Soil Profile Definition and Soil Parameters used in the Model	238
I.1	Engineering Borehole Log for PI1	241
J.1	Data of Constant Rate Pumping Test a the Observation Well PI1	245
J.2	Data of the Recovery Test a the Observation Well PI1	247
J.3	Determination of Hydraulic Conductivity for the Deep Aquifer Using Constant Head Permeability Test at Borehole PI1	249
J.4	Determination of Hydraulic Conductivity for the Second Layer Using Constant Head Permeability Test at Borehole PI2	250
J.5	Determination of Hydraulic Conductivity for the Shallow Aquifer Using Constant Head Permeability Test at Borehole PI3	251
J.6	Measurements of Ground Subsidence at Megasteel Co. Ltd Area for the period 2001 – 2006	252
J.7	Measurements of Ground Subsidence at Megasteel Co. Ltd Area for the period 2000 – 2007	253

## LIST OF PHOTOGRAPHS

PHOTO No.		Page
K.1	Kick-start Visit1	254
K.2	Kick-start Visi2	255
K.3	Peat Big Days	256
K.4	Infiltration Test at Kg Sg Manggis	257
K.5	Infiltration Test near the marsh Lake	258
K.6	Retrieving Groundwater Data of BH3	259
K.7	Checking the Coordinates of BH6 before Retrieving the Groundwater Level Data from the Automatic Logger.	260
K.8	Heading towards BH6 across the Langat River	260
K.9	Gauging at SWL1	261
K.10	Gauging at SWL2	262
K.11	Automatic logger at SWL1	263
K.12	Automatic logger at SWL2	264
K.13	Automatic logger at Main-Visitor Connection	264
K.14	Inflow from Cyberjaya City on a Rainy Day. The North South Expressway Central Link (NSECL) also appears on the picture	265
K.15	Visitor Lake Overview	266
K.16	Main Lake Overview	266
K.17	Culvert of the Main-Palm Connection	267
K.18	Main-Palm Connection heading towards the Lotus Lake	267
K.19	Overview of the Main and Driftwood Lakes	268
K.20	Tin-Driftwood Connection	268
K.21	Padi (ex-) Lake and it Functionless Culvert	269

K.22	Swamp-hen (semi-) Lake Overview	270
K.23	Connection Point between Lotus-Swamp-hen Connection and Lotus Lake	271
K.24	Typha Lake Overview	272
K.25	Lotus lake Overview	272
K.26	Lotus-outlet Control Gate: Front View	273
K.27	Lotus-outlet Control Gate: Front View	273
K.28	Outlet heading towards Langat River	274
K.29	Wildlife Habitats	274
K.30	Deep inside the Peat Paradise's Blanket	275

## LIST OF SYMBOLS AND ABBREVIATIONS

b.s.l.:	below the sea level
BH:	Borehole
CE:	Coefficient of efficiency
DID:	Drainage and Irrigation Department of Malaysia
ET:	Actual Evapotranspiration
Evap:	Evaporation
Exfilt:	Exfiltration
GIS:	Geographic information system
Infilt:	Infiltration
$k$ :	Hydraulic conductivity
Kg:	Kampung (village)
KLIA:	Kuala Lumpur International Airport
m:	Meter
M:	The reciprocal of Manning's $n$
MAE:	Mean average error
ME:	Mean error
MLD:	Mined Land
MMD:	Malaysia Meteorological Department
$n$ :	Manning's number
NSECL:	North-South Expressway Central Link
OL:	Overland flow
$P$ :	Probability
P:	Precipitation

PRG:	Perang soil series
QG,in:	Groundwater flow into the model area
QG,out:	Groundwater flow out of the model area
QS:	Surface water inflow
QS,out:	Surface water flow out of the model area
$R$ :	hydraulic radius
$R$ :	Coefficient of correlation
$R^2$ :	Pearson type-I distribution index
RMSE:	Root mean square error
$S_c$ :	Storage coefficient of groundwater
$S$ :	channel bed slope
SBM.	Serdang-Bungor-Munchong soil series
$S_g$ :	Sungai (River)
SKG:	Selangor-Kanchung soil series
$STD_{res}$ :	Standard deviation of the residuals
SZ:	Saturated zone
UZ:	Unsaturated zone
$T$ :	Transmissivity
Trans:	Transpiration
$V$ :	Flow velocity
$\Delta S$ :	Change in storage of surface water, unsaturated zone and groundwater ( $S_s + (S_{uz} + (S_{sz}))$ )
