Abstract

The research paper investigates the presence of asymmetry information in Health and Surgical Insurance in Malaysian market. For that purpose, an econometric model is formulated and estimated by using data from insurance companies based on the model used by Cawley and Philipson (1999). The model has price as a dependant variable and regressed against consumers' characteristics. The results show that the unit price tends to increase with level of risk or quadratic pricing. The pricing schedule is necessary for companies to break even as it can minimize the impact of informational disadvantage. This is because high risk individuals will purchase higher than average quantity of coverage. A logit model is formulated and estimated to investigate the relationship between high risk individuals and probability of holding larger quantity. The paper highlighted the presence of asymmetry information in Health and Surgical Insurance. Its presence is detrimental to efficiency of trade. Companies will reject risk, which is not familiar, consumers with lower risk propensity will be paying higher premium than the risk level they face, moral hazard problems, and etc. These problems arise from the benefit of misrepresentation in the proposals, which in turn determine the decision making of the companies. Loss of trade or Pareto inefficiency in trade can be overcome with customized policies, offer policy based on observable consumption of correlative products, and public intervention. The problems of asymmetry information do not only occur in insurance market, but it is also apparent in other markets as long as there exist benefit for the parties to cheat or lie.

TABLE OF CONTENT

Abstract	ii
Table of Contents	iii
List of Figures	vi
List of Tables	vii
Chapter 1 Introduction	
1.1 Overview	1
1.2 Issues Concerned	5
1.3 Objective of The Research	7
1.4 Outline of Research	7
Chapter 2 Literature Review	
2.1 Introduction	9
2.2 Asymmetry Information In Non-Insurance Market	9
2.3 Asymmetry Information In Insurance Market	11
Chapter 3 Theoretical Framework	
3.1 Introduction	16
3.2 Model For Non-linearity In Prices	17
3.2.1 Perfect Information	17
3.2.2 Imperfect Information	20
3.2.3 Pooling Equilibrium	22
3.2.4 Separating Equilibrium	25

3.2.5 Insurance Under Asymmetry Information	28
3.3 Covariance Between Risk And Quantity	30
3.4 Conclusion	31
Chapter 4 Methodology	
4.1 Introduction	32
4.2 Data	35
4.3 Assessing The Non-linearity In Prices	35
4.4 Logit Model For Covariance Between Quantity and Risk	38
4.5 Conclusion	40
Chapter 5 Result and Data Analysis	
5.1 Introduction	41
5.2 Assessing The Non-linearity In Prices (Male Category)	43
5.3 Logit Model For Covariance Between Risk And Quantity	53
5.4 Assessing Non-Linearity In Prices (Female Category)	56
5.5 Conclusion	65
Chapter 6 Conclusion	
6.1 Introduction	66
6.2 Summary Of The Findings	65
6.3 Contributions Of The Research	66
6.4 Implications and Suggestions	67

6.5 Problems In The Research	71
6.6 Conclusion	73
Appendix A Types Of Policies For Male Category	74
Appendix B Types Of Policies For Female Category	83
Appendix C Regression Results For Covariance Between Price And Quantity	88
