Figure 2.1 Structure of SWNTs as shown in (a) and structure of MWCNTs as shown in (b).

Figure 2.2 Basic hexagonal bonding structures for one graphite layer (the ‘graphene sheet’). Carbon nuclei shown as filled circle, out-of-plane \( \pi \)-bonds, and \( \sigma \)-bonds connect the C nuclei in-plane.

Figure 2.3 The honeycomb lattice of graphene. The hexagonal unit cell contains two carbon atoms (A and B). The chiral vector determining the structure of a carbon nanotube is given by \( L \), and its length gives the circumference. The chiral angle is denoted by \( \eta \), with \( \eta = 0 \) corresponding to zigzag nanotubes and \( \eta = \pi/6 \) to armchair nanotubes.
