ABSTRACT

The aim of this study is to investigate the use of the simpler porphyrin, Hematoporphyrin (Hp) as a possible photosensitizer for the treatment of malignancies using the alternative Immediate photodynamic therapy (PDT) procedure. In Immediate PDT, photoradiation was administered 5 mins after the administration of drugs as opposed to the conventional delayed (24-48 hrs) treatment procedure. The serum and tissues pharmacokinetics of Hp with comparison to its derivatives, HpD and their therapeutic efficacies have been investigated. A five compartmental model was developed to quantify the analysis of serum and tissue distribution of the drugs with liver as the main store. The pharmacokinetics showed that Hp has a 4 times smaller half-life in serum than HpD. The oligomeric component of HpD has an excretion rate of about 90 times slower from the liver than the monomeric component of Hp from the serum and tissues. The murine tumour response indicated that Hp needed a 3.5 times more drug-light dose product for a similar therapeutic effect with comparison to HpD. Nevertheless one could still minimise skin photosensitivity because of its rapid excretion. A study on the histomorphological changes in both the drugs indicated comparable tumour cell, surrounding normal tissue and vasculature necrosis. A comparison of the skin reaction and the duration of skin photosensitivity were also investigated. The results showed that Hp exhibited negligible skin photosensitivity compared to HpD. In order to develop a local Hp-Immediate PDT protocol for clinical trials in the near future, the conventional delayed PDT procedure with HpD was employed on three patients for the necessity of groundwork. The basis of this includes the preparation and characterization of HpD and the development of two alternative halogen light sources. Studies carried out using the halogen light sources
ACKNOWLEDGEMENTS

My sincere and heart-felt gratitude goes to my immediate supervisor, Prof. K.S. Low, for his help, guidance and many thoughtful discussions regarding this thesis. His support, encouragements, comments and criticisms were particularly helpful throughout this thesis. I wish to express my heart-felt thanks to my co-supervisors, Dr. A.S. Haji Baba for all his contribution, assistance and support especially in the biochemistry aspects of this work and Assoc. Prof. C.H. Yip in the medical aspects.

I wish to acknowledge with thanks the members of the PDT research programme who have helped and supported my work in numerous ways. In particular I thank, Assoc. Prof. J. Pailoor for her contribution in the pathology aspects of this work. Thanks to her invaluable guidance and time spent in this work. I would also like to take this opportunity to thank Prof. N.H. Tan, Dr. G. Baskaran, Prof. L.M. Looi and Ms. Y.L. Lo.

It is also my joy to extend my sincere thanks to Mr. Balam for his superb technical assistance which enable me to complete this thesis. My special thanks to Mr. Leong for his spontaneous availability and his help especially in the animal work. I would like to thank Assoc. Prof. C.K.Sam for allowing me to use the facilities in her laboratory. Thanks also to the personnel in DCL, Ministry of Health and the Department of Microbiology whom had lend a helping hand.

To my friends and fellow graduate students, I am grateful for their gift of friendship, support and sharing with me the weight of this thesis. In particular, I record my thanks to Siew, Quek, Harlina, Min Dea, Tham, Norliza, Chandrika, Asril, Anandan and Siew Choo. Finally, words are not enough to express my heart-felt gratitude to my dad and mum, my brother and to all my brothers and sisters in Christ for their support, encouragement and prayers that helped me complete this work.

Chan Hor Kuan, 1999.
showed that they were reliable, cost-effective and their manoeuvrability in the clinical environment made them suitable as an alternative to the laser for the surface irradiation of tumours. The clinical results showed significant responses in palliation control on advanced external lesions.
ABSTRAK

itu, lampu-lampu halogen ini menghasilkan satu alternatif kepada sistem laser sebagai punca penyinaran pada permukaan sel-sel barah. Percubaan klinikal menunjukkan tindakbalas pengawalan pemulihan yang baik pada sel-sel barah tahap serius.
