ACKNOWLEDGEMENTS

This project paper could not have been possible without the guidance of my supervisor and lecturer, Associate Prof Dr. Kwek Kian Teng. Her patient advice, ideas and support, as well as her lectures on Applied Macroeconomics have allowed me to complete this research paper. I also wish to extend my gratitude to all the lecturers of the master program at the Faculty of Economics and Administration, namely, Associate Prof. Dr. Tan Eu Chye, Associate Prof. Goh Kim Leng, Prof Dr.Kok Kim Lian, Ass. Prof Dr. Cassey Lee, Dr. Yeah Kok Kheng, Dr Yap Su Fei and Dr Rohana Jani for their insightful lectures, support and guidance throughout the whole course period.

In addition, I would also like to express my thanks to Ch'ng Boon Chong, Loh Weng Si, Cho Cho Wai, Tung Yin Wai, my friends and colleagues at work whom have helped me, in one way or another, to finish this paper on time. Last but not least, I am also forever indebted to my parents for all their love, wisdom and guidance. Thank you all.

ABSTRACT

The purpose of this paper is to explore the effect of the world oil price and gold price shocks on the economic growth of a country. In this paper, we test the impact of the commodities' price shocks in two countries, Malaysia and the US. The reason these two countries were used is to enable the comparison between a developing country and a developed country, as well as the comparison between an oil-producing country and oil-importing country. Generally, we expect a net oil importing country such as the US to be negatively affected by the oil price hike; and a net exporting country such as Malaysia to benefit from an oil price shock. In initial OLS test, we found that the oil prices and gold prices have significant relationship with the GDP in Malaysia and the US. Both regressions, oil prices and gold prices are significant at 5% level. Gold prices are positively related to the GDP while the oil prices are negatively related to the GDP. Next the vector autoregression (VAR) test is carried out to characterize the dynamic structure of the model as well as its ability to avoid the imposition of excessive identifying restrictions associated with different economic theories. VAR results shows that past GDP innovations do not contain any significant information about the variation of either gold prices or oil prices. It confirms the assertion that gold prices and oil prices do not contribute much in the supporting role of supplementing information about current and future output movement. A study on the impulse response function shows that the response of oil price on one standard deviation innovation dies out more quickly compared to the response of gold price in Malaysia and the US. Therefore, the impact of oil price shock is more important compared to a gold price shock, as seen in the variance decomposition result. Between the two countries, the impact of oil price and gold price shocks are more pronounced in Malaysia as compared to the US. Granger causality test also shows uni-directional causality from gold price and oil price to GDP in both Malaysia and the US case. The research also failed to find any significant difference between the impact of oil price shocks on the growth rate on an oil-exporting country, Malaysia and an oil-importing country, the US. We then look at the underlying causes of the movement in the commodities' prices and the channel through which the oil price can impact the economy. In addition, this paper also details the historical rally in prices for the commodity gold and crude oil.

TABLE ON CONTENTS

	Page
Acknowledgements	ii
Abstract	iii
List of Tables	vi
List of Figures	vii
Chapter 1: Introduction	
1.1 Introduction	1
1.2 Objective of Study	3
1.3 Statistical Program	3
1.4 Organization of Study	3
Chapter 2: Literature Review	
2.1 Overview	5
2.2 Literature on Commodity Prices in General	5
2.3 Literature Regarding Oil Price Shock	9
2.4 Literature Regarding Gold Price Shock	16
Chapter 3: Historical Background on Oil and Gold Price Shocks	
3.1 The History of Crude Oil and Gold Price Shocks	22
3.2 Crude Oil	
3.2.1 Introduction	24
3.2.2 Crude Oil Price History and Analysis	25
3.3 Gold	
3.3.1 Introduction	29
3.3.2 Gold Price History and Analysis	31
3.4 The Malaysian Economy	
3.4.1 Introduction	36
3.4.2 Analysis of Oil and Gold Price Shock in Malaysia	39

Chapter 4: Data and Methodology	
4.1 Introduction	43
4.2 Data	43
4.3 Methodology	
4.3.1 Initial Testing	44
4.3.2 Vector Autoregression (VAR)	45
4.3.3 Impulse Response Function(IRF) and Variance Decomposition(VD)	47
4.3.4 Granger Causality Model	49
Chapter 5: Empirical Results	
5.1 Initial Findings on the Relationship Between Oil Prices, Gold Prices and GDP in Malaysia and the US.	51
5.2 VAR, IFR and VD Results	52
5.3 Granger Causality	63
5.4 Conclusion	64
Chapter 6: Conclusion	
6.1 Introduction	66
6.2 In Perspective	66
6.2 Factors Affecting Commodity Prices	67
6.3 The Impact of High Oil Prices on the Economy	68
6.4 Limitations of the Study	70
