Chapter 3 – Experimental Details

3.1 Materials and Gases

3.2 Methodology of Catalyst Synthesis and Activation

3.2.1 Preparation of Catalyst Precursors

3.2.1. (a) Preparation of precursor P1 – nitrates route

3.2.1. (b) Preparation of precursor P2 – citrate-nitrate route

3.2.2. Catalyst Preparation Procedure – Impregnation, SIWI and DIWI

3.2.3. Catalyst Activation

3.3 Catalytic Performance: High Throughput Screening

3.4 Product Analysis

3.4.1. GC Calibration

3.4.2. Activity Calculation

3.5 General Characterization Procedures

3.5.1 Structural Analysis

3.5.1. (a) X-Ray Powder Diffraction (XRD) Analysis

3.5.1.(b) Nitrogen Physisorption Measurements

3.5.1. (c) Scanning electron microscopy and X-ray Dispersive Analysis

(SEM and EDX)

3.5.1. (d) Diffuse reflectance of UV-Visible

3.5.1. (e) Fourier Transform Infrared Transmission (FTIR)

3.5.2 Thermal Analysis

3.5.2. (a) Thermogravimetric (TGA) Analysis and Differential Scanning Calorimetric (DSC)

3.5.2. (b) Temperature-Programmed Reduction (TPR)
Chapter Four - Catalytic Performances: High Throughput Catalysts

Screening

4.1 Introduction of Preliminary Work

4.2 Catalytic Performance

4.2.1 General Overview

4.2.2 Influence of Preparation Method and Support

4.2.3 Influence of Precursors

4.2.4 Influence of binary catalysts: Addition of 2nd Metal (Cu:M2)

4.2.5 Influence of metal-metal ratio (Cu: M2)

4.3 General Conclusion of Catalytic Performances

Chapter Five - Discussion on Structural and Thermal Properties of Catalysts

5.1 Structural Analysis

5.1.1 Powder X-ray diffraction (XRD)

5.1.2 Surface Area Measurement

5.1.3 SEM and EDX: Structural and Morphology Study

5.1.4 UV-Vis characterization

5.1.5 FTIR Characterization

5.2 Thermal Analysis

5.2.1 TGA and DSC

5.2.2 Reduction Behavior
# Chapter Six - Conclusion

6.1. Overall Conclusion of Catalytic Performances 197
6.2. Overall Conclusion of Catalysts Properties 197
6.3. Future Prospects and Challenges 199

Figure 3.15: The IUPAC Classification of Adsorption Isotherms

Figure 4.1: Project Work Flow – Application of Combinatorial Technology

Figure 4.2: Yield to ethanol and ethyl acetate vs. methyl acetate conversion at 423-623 K and a H₂/methyl acetate molar ratio of 7.5 on monometallic catalysts with silica and alumina support. Only mono-metallic catalyst copper (blue) and iron (yellow) gave significant activities.

Figure 4.3: Yield to ethanol and ethyl acetate vs. methyl acetate conversion for monometallic catalysts at a H₂/methyl acetate molar ratio of 7.5 and 423-623 K. Catalyst are grouped by precursor salt and pH of the precursor solution. There is no definite trend of the effect of pH on catalysts (especially between pH 5 and 7). However, it was observed under light microscope that the most stable and homogeneous solution occurred at pH 7.

Figure 4.4: Yield to ethanol and ethyl acetate vs. methyl acetate conversion for monometallic catalysts at a H₂/methyl acetate molar ratio of 7.5 and 423-623 K. Catalyst are grouped by precursor additives: none (nitratre), citric acid (citrate) and ammonium citrate (AC). Improved precursor (addition of citric acid; citrate route) seems to be more interesting compared to the sole nitratre precursor.

Figure 4.5: Performance observed at 423-623 K and a H₂/methyl acetate molar ratio of 7.5, mono-copper catalysts (red), bimetallic Cu-Co (blue), bi-metallic Cu-Fe (yellow), bi-metallic Cu-Zn (light grey) and bi-metallic Cu-Ni (green). Catalytic performance of copper improved with the addition of 2nd metal; the top performing catalysts from Cu-Fe and Cu-Zn catalyst series.

Figure 4.6: Selectivity towards Dodecanol (Y-axis) vs. Conversion of Methyl Laurate (X-Axis) for catalysts tested at 100bar and 523.15K for 4 hours.

Figure 4.7: Selectivity towards Dodecanol (Y-axis) vs. Yield of Dodecanol (X-Axis) for catalysts tested at 100bar and 523.15K for 4 hours.

Figure 4.8: Activity in mmol Dodecanol formed/gram catalyst/per hours (Y-axis) vs. Conversion of Methyl Laurate (X-Axis) for catalysts tested at 100bar and 523.15K for 4 hours.

Figure 4.9: Activity expressed as mmol dodecanol formed/gram catalyst used/hours of reaction (Axis-Y) vs. metal composition of catalysts prepared via nitratre route (precursor P1). Most of the DIWI catalysts performed better than SIWI, with 2 categories exceptions: Cu-Fe at/at 3:1 and Cu-Zn at/at 1:1.
Figure 4.10: Activity expressed as mmol dodecanol formed/gram catalyst used/hours of reaction (Axis-Y) vs. metal composition of catalysts prepared via citrate-nitrate route (precursor P2). The higher performance of the DIWI catalysts are more apparent and significant.

Figure 4.11: Activity expressed as mmol dodecanol formed/gram catalyst used/hours of reaction (Axis-Y) vs. metal composition of catalysts prepared using single incipient wetness impregnation.

Figure 4.12: Activity expressed as mmol dodecanol formed/gram catalyst used/hours of reaction (Axis-Y) vs. metal composition of catalysts prepared using double incipient wetness impregnation.

Figure 4.13: Activity expressed as mmol dodecanol formed/gram catalyst used/hours of reaction (Axis-Y) grouped according to method preparation and precursors.

Figure 4.14: Activity expressed as mmol dodecanol formed/gram catalyst used/hours of reaction (Axis-Y) grouped according to codes: (A) SIWI catalyst, (B) DIWI catalysts.
