ACKNOWLEDGEMENT

I firstly wish to express my utmost appreciation to Encik Ramil Bahroom of the School of Business and Accountancy, University Malaya for his encouragement, support, patience and guidance whilst acting as my supervisor for my MBA thesis.

I am also highly grateful to my friend and classmate Mr. Ong Boo Ee who assisted in processing and analysis of certain data. He was also kind enough to have taken time and trouble to read through my manuscript and offer much valuable advice.

Finally, I am indebted to both my parents whose support and understanding was crucial in pursuance of this course.

Any deficiencies in this thesis remain solely my own responsibility.

ABSTRACT

This research was carried out with two primary objectives namely to investigate the relationship between Economic Value Added (EVA) and stock returns and how it compares with conventional accounting measures in explaining stock returns. The results indicate that there is a significant positive relationship between EVA and stock returns. Although the relationship is positive, it is relatively weak. All the accounting performance measures also exhibit a positive relationship with stocks. With regards to the ability of EVA in explaining stock returns, it was better compared to any of the accounting performance measures. The best accounting measure was price earnings ratio. Based on the result of this research, investors should pay more attention to EVA and manager should realign their performance measurement system to take into account EVA.
