SUBMITTED TO THE FACULTY OF ECONOMICS AND ADMINISTRATION, UNIVERSITY OF MALAYA IN PARTIAL FULFILMENT OF THE REQUIREMENT FOR THE DEGREE OF MASTER OF ECONOMICS

NOVEMBER 2004

ACKNOWLEDGEMENT

I remain indebted to my academic supervisor Associate Proffesor Dr. Yap Su Fei who generously offered her advice, patience and time in the shaping of this project paper. Her vast knowledge, experience, and ever critical outlook will continue to have an affirmative impact on my academic orientation. Professor Dr. Kwek Kian Teng and Professor Dr. Tan Eu Chye, continued to extend their encouragement and provided counsel especially for econometric procedures.

My warmest appreciation and gratitude is also extended to my parents and my siblings. They have been a comfort and an inspiration in my work and most important my source of strength in all my undertakings

The support of my dearest friend, Daren as always reminds me of how fortunate I am. Close friends and companions such as Letchumi, Dzul and wife, Firdaus, Faidz, Beleza, Ana, Pits and Chong Chin Sieng. Proved their friendship by understanding when I had to desert them.

Last but not least to the staff of economic faculty and Pn. Rohinee (Canseleri) being there when I most needed them.

ABSTRACTS

We examined the impact of monetary policy using Malaysia data on Malaysia Government Securities which allow us to decompose nominal interest rates into inflation expectations and ex-ante real interest rate. Data were collected from financial market to separate the reaction of both real interest rates and inflation expectations to monetary policy shocks and also reaction of monetary policy shocks to short term and long term end of real interest rates.

By using VAR approach, we examined the effects of monetary policy shock to these macroeconomic variables. Before proceeding to the VAR analysis, there are some of steps such as Unit Root Test and Johansen Cointegration was utilized.

Monetary policy shock defined by raising the overnight rate the Bank Negara Malaysia charges member banks, lower real interest rates and inflation expectations. Long term real interest rates are less impacted than short term interest rates.

Real interest rates have the effect to the economy but the inflation expectations have a greater effect to the economy. These were proven by the impulse response function of the nominal interest rates and real interest rates to the changes of inflation expectations by the investors.
