ABSTRACT

Hedonic regression model has been widely used in other countries in an attempt to understand the micro variables influencing the housing prices. There is an abundant literature in different forms but with the same underlying techniques of using hedonic regression to create models. Hence, this paper attempts to adopt the hedonic house pricing with multiple regression in different states of Malaysia. In addition, this study investigates the macro economic variables to determine its relationship to the Housing Price Index. This paper uses the extensive data set available from the published reports of Jabatan Penilaian dan Perkhidmatan Harta and Bank Negara Malaysia Statistics. On the surface of it, this research looks simple but is actually full of challenges to overcome. The mean price has been adopted as the transaction value of housing price. A total of ten states with ninety-seven districts and eight types of houses over seven years quarterly periods were used in the data set of micro variables. The results confirmed that Malaysians prefer superior residential housing units over the inferior types. The encouraging results of this study showed that the housing attributes can significantly explain for the changes in housing prices and can be used in hedonic regression model to estimate the housing price. However, the results from the macro economic analysis were mixed. This study will be useful for property investors and managers especially in financial decision making and risk management process.
I would like to take this opportunity to express my gratitude towards the following groups of people who have given me continuous support and guidance throughout the entire course of this project paper. First and foremost, I would like to extend my deepest appreciation and thanks towards my supervisor, Dr. Mohamed Albaity, who not only guided me but also provided me the knowledge and means in completing this research. I would like to thank Jabatan Penilaian dan Perkhidmatan Harta, Kementarian Kewangan Malaysia for the permission to use its Residential Property Stock Report and Bank Negara Malaysia for its statistics provided to me during my data collection of residential property transactions and economic factors. As not to forget the facility provided by UM Library, the resource centre equipped with references and online Database services allowed me to complete my research for this project paper with less difficulty. I would love to express my highest appreciation to my dear wife for her care and support during this very difficult period. Last but not least, I would like to thank my family members and friends that provided me never-ending support, their concern and care in my completion of this project. With their support and understanding, I was able to complete this project smoothly.
