ABSTRACT

This work describes a simple and rapid extraction method by using solid-phase microextraction (SPME) technique for the determination of polycyclic aromatic hydrocarbons (PAHs) from mosses of *Hyophila involuta* which is found commonly and abundantly throughout Peninsular Malaysia. Mosses have been chosen in our study since they are effective bioindicators as they take up nutrients and pollutants directly from the atmosphere and they have no root system. These properties make them ideal for evaluating pollutant levels in the air over a monitored period of time. This study has been developed and optimized based on the extraction of the analytes of interest from the headspace over the moss samples with SPME followed by the analysis by gas chromatography-flame ionization detector (GC-FID). Factors affecting the SPME method, such as extraction mode and effects of the addition of chemical modifiers were evaluated, and the precision, linearity and detection limits were validated. Extraction was performed using operating conditions with standard addition method using 100 μm poly(dimethylsiloxane) (PDMS) fiber under the following conditions: extraction temperature of 150 $^{\circ}\text{C}$, extraction time of 90 min, desorption time and temperature of 15 min and 275 $^{\circ}\text{C}$, respectively, with the addition of 250 μl of 5% (w/v) NaCl salt solution. The headspace SPME method was developed using non-spiked and spiked moss samples in a concentration range of 0-2600 ng/g. The method showed good linearity for the tested concentration range with regression coefficient ranging between 0.9721 and 0.9974. The relative standard deviations which were determined at the low (150 ng/g), mid (2000 ng/g) and high (2600 ng/g) concentrations for all PAHs were between 2-37%, except for some compounds (benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, and indeno(123-cd)pyrene) which exhibited slightly higher values (42-69%). Recoveries were in relatively high levels for all

compounds at three different concentration levels, and ranged from 80-119% except for a few compounds (benzo(k)fluoranthene, indeno(123-cd)pyrene, dibenzo(ah)anthracene, and benzo(ghi)perylene) which showed lower recoveries (23-67%) at concentration level of 150 ng/g. The detection and quantification limits were 1.3-193.1 pg/g and 4.2-643.6 pg/g, respectively for all PAH compounds studied. The developed method was then applied for the quantification of PAH compounds with heavy traffic pollution from contaminated moss samples collected from selected stations in the Klang Valley area.

ABSTRAK
(VERSI BAHASA MALAYSIA)

Kerja ini menerangkan satu kaedah pengekstrakan yang cepat and ringkas dengan menggunakan teknik solid-phase microextraction (SPME) untuk pentafsiran kehadiran polisiklik aromatik hidrokarbon (PAH) dalam lumut *Hyophila involuta* yang dijumpai secara umum dengan banyaknya di Semenanjung Malaysia. Lumut telah dipilih untuk dikaji kerana mereka adalah bioindikator yang berkesan dimana mereka mengambil nutrien dan polutan terus daripada atmosfera dan juga tidak mempunyai sistem akar. Sifat-sifat ini membolehkan lumut menilai peringkat polutan di dalam udara untuk suatu tempoh masa. Kajian ini telah dikembangkan dan dioptimumkan berdasarkan pengekstrakan analit-analit yang diminati daripada headspace atas sampel-sampel lumut dengan SPME diikuti oleh analisis kromatografi gas-pengesan pengionan nyala (GC-FID). Faktor-faktor yang mempengaruhi kaedah SPME, seperti mode pengekstrakan dan kesan daripada penambahan kimia pengubah telah dinilai, dan ketelitian, linieritas dan batas deteksi telah disahkan. Pengekstrakan telah dilakukan menggunakan keadaan operasi kaedah standard samping dengan 100 μm polydimethylsiloxane (PDMS) fiber dibawah keadaan-keadaan berikut: suhu pengesktrakan pada 150 °C, masa pengekstrakan selama 90 min, masa dan suhu desorpsi selama 15 min dan 275 °C masing-masing, dengan penambahan sebanyak 250 μl 5% (w/v) NaCl larutan garam. Kaedah headspace SPME telah dibangunkan dengan menggunakan sampel-sampel lumut yang tidak spike dan yang sudah spike dalam julat kepekatan 0-2600 ng/g. Kaedah ini menunjukkan linearitas yang baik untuk julat yang diuji dengan pekali regresi dalam lingkungan antara 0.9721 dan 0.9974. Relatif standard deviasi yang telah ditentukan pada kepekatan rendah (150 ng/g), sederhana (2000 ng/g) dan tinggi (2600 ng/g) untuk semua PAH adalah antara 2-37%, kecuali untuk beberapa sebatian (benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, and indeno(123-

cd)pyrene) yang mempamerkan nilai peratusan yang agak tinggi (42-69%). Recoveries adalah agak tinggi tahapnya untuk semua sebatian PAH bagi ketiga-tiga tahap kepekatan, dan berada dalam julat 80-119% kecuali untuk beberapa sebatian (benzo(k)fluoranthene, indeno(123-cd)pyrene, dibenzo(ah)anthracene, and benzo(ghi)perylene) yang mempamerkan recoveries yang rendah (23-67%). Batas pengesanan and kuantifikasi adalah dalam lingkungan 1.3-193.1 pg/g dan 4.2-643.6 pg/g masing-masing untuk semua sebatian yang diuji. Kaedah headspace SPME yang dikembangkan kemudian diguna untuk pengkuantifikasi sebatian-sebatian PAH dengan pencemaran lalu lintas yang padat daripada lumut-lumut yang nyata tercemar yang dikumpul daripada pilihan stesen-stesen di sekitar kawasan Lembah Klang.

ACKNOWLEDGEMENT

First and foremost, I would like to express my sincere gratitude to my supervisor, Associate Professor Dr. Richard Wong Chee Seng for all his invaluable guidance and dedication throughout this research. He has also provided me with important field assistance during the collection of moss samples. I deeply appreciate all his support and care given to me during my stay as his postgraduate student.

I would also like to thank Dr. Yong Kien Thai from the Institute of Biological Sciences, Faculty of Science, UM for helping me with the collection of moss samples from Fraser's Hill, demonstrating to me on the cleaning and preparation of moss samples and also on the identification of the moss species *Hyophila involuta*.

I sincerely express my gratitude to Professor Kam Toh Seok and Professor Tan Guan Huat for taking their time to give me invaluable guidance and advices during my stay as a postgraduate student.

I am grateful to know and to have shared sweet memories with my seniors – Miss Ooi Mei Lee and Miss Chan Chun Foong, special thanks to them for their advices and guidance throughout my stay as a postgraduate student. I won't forget the time and wonderful moments I have spent with my juniors in the laboratory – Miss Ngue Chin May, Mr. Ang Chun Hui and Mr Ngan Ngui Khiong.

My uttermost appreciation goes to my family, relatives, dear one and my friends for their constant support, love, patience and care throughout my research in UM.

Lastly, financial support consisting of the research PPP grant (PS207/2008A) and UM Fellowship Scheme from the University of Malaya are deeply appreciated and acknowledged.
