ABSTRACT

Introduction

Oral cancer is a significant health problem worldwide with almost 300,000 new cases are diagnosed each year. Despite the numerous studies done, and even with the best treatment option utilized, more than 50% of patients with oral cancer will experience relapse. In search for better options for prognostication, researches are now focusing on the molecular biology of cancer, for instance in search of reliable tumor markers. Among the markers reported in the literatures, Cyclin D1 is actively studied protein. Cyclin D1 regulates the cell cycle progression by forming a complex with different cyclin dependant kinase. Dysregulation of cyclin D1 can result in loss of normal cell growth and tumor development. The aim of this study is to determine and compare the amplification of Cyclin D1 in buccal mucosa and tongue oral squamous cell carcinoma(OSCC) and to associate its amplification in buccal mucosa and tongue OSCC with tumor depth, tumor front, histopathological grading, pathological tumor size, lymph node status, TNM staging and survival rate.

Materials and methods

The study samples were paraffin-embedded OSCC surgical specimens obtained from the archives of the Department of Oral Pathology, Oral Medicin and periodontolgy and Oral Pathology Diagnostic Laboratory. Fifty samples of patients with primary OSCC of buccal mucosa and tongue were included in the study. The sociodemographic and clinical data were obtained from the Malaysian Oral Cancer Tumor and Database System coordinated by the Oral Cancer Research and Coordinating Centre (OCRCC), University of Malaya. There were 31(62%) female and 19(38%) male with the overall age ranging from 26 to 94 years with a mean age of 60 years.
The OSCC samples were from 44(68%) Indians, 10(20%) Malays and 6(12%) Chinese. The fluorescent-in-situ hybridization (FISH) technique was used to detect the amplification of Cyclin D1 using the Vysis protocol. Fluorescence evaluation of Cyclin D1 was performed using the image analyzer where the Cyclin D1 amplification signal appears as a small spot. At least 200 nuclei were scored using a 100X objective in each defined histological area, and each nucleus was assessed for the chromosome copy number. Statistical correlations of Cyclin D1 and certain clinicopathological parameters of OSCC were analyzed using the chi-square method or Fisher’s exact test.

**Results**

The present study found positive amplification of cyclin D1 in 72% (36) of OSCC. Detection of positive amplification for cyclin D1 was observed in 88% (22) and 56% (14) of the tongue and buccal mucosa OSCC respectively where the difference was statistically significant (p=0.012). There was a significant correlation between Cyclin D1 positivity and ethnicity for the OSCC of the buccal mucosa (p=0.037); larger pathological tumor greatest dimension (pT) (p = 0.019), higher pTNM stages (p=0.014), tumor depth ≥ 5mm in tongue cases (p<0.001) and survival rate (p=0.009) for overall SCC cases and (p<0.001) for buccal mucosa SCC cases.

**Conclusion**

There is a significant correlation between amplification of Cyclin D1 with tumor depth and size of the tumor for tongue SCC; ethnicity and survival rate for buccal mucosa SCC.
ACKNOWLEDGEMENTS

First of all, I thank Allah the Almighty, for granting me the will and strength to accomplish this modest research. I pray that Allah’s blessing upon me continue throughout my life, and Allah’s blessing and peace be upon the messenger Mohammad.

I would like to express my sincere appreciation and deepest gratitude to my first supervisor Dr. Siti and second supervisor Prof. Dr. Rosnah Binti Mohd Zain for Their inspiration and continuous scientific suggestions throughout the preparation of this thesis. Their efforts are deeply appreciated.

My great thanks and praise goes to the Head of Oral and Maxillofacial Department Prof. Zainal Arif Bin Abdul Rahman whose inspiration and unconditional will to teach enabled me and my fellow trainees to reach this stage.

I also seize this opportunity to thank and appreciate the efforts and moral support presented by the lecturers, my colleagues and the staff of the Department of Oral and Maxillofacial Surgery.

All the staff in Division of Pathology lab was an invaluable asset to my work and I would like to specify Dr Thomas Abraham, Dr. Thomas G. Kallarakkal, Dr. Anand R, Mrs Khoo Guat Sim, Mrs Rusnani Kamal and Mr. Siew Koi Kheong for all their assistance.

Last but not least, my parents for believing in me and for their continuous support. I dedicate this thesis to them.
