ACKNOWLEDGEMENT

In the name of Allah, most gracious, most merciful

First of all, I would like to thank the Almighty Allah for granting me the will and strength to accomplish this research. I pray that Allah's blessings upon me to continue throughout my life, and Allah's blessing and peace be upon the messenger Mohammad (SAW).

This dissertation would not have been possible without the guidance and the help of several individuals who in one way or another contributed and extended their valuable assistance in the preparation and completion of this study.

Associate Prof. Dr. Palasuntharam Shanmuhasuntharam, my supervisor whose encouragement and guidance enabled me to develop an understanding of the subject;

My utmost gratitude to Professor Dr. Phrabhakaran A/L K N Nambiar, my second supervisor, whose sincerity and encouragement I will never forget. He has been my inspiration as I tried to overcome all the obstacles in the completion of this research work;

Dr. Marhazlinda Binti Jamaludin for her inputs especially in the statistical part of this study. She has shared valuable insights, knowledge and experience.

Professor Zainal Arrif Bin Abdul Rahman, the former Head of Department of Oral and Maxillofacial, for his kind concern and consideration regarding my academic requirements.

Dr. Siti Mazlipah Ismail, Head of Department of Oral and Maxillofacial, for the moral support despite being newly appointed;

Professor Dr. Rosnah Bt. Mohd Zain, Dean of the College of Dentistry, for the insights she had shared;

I also would like to thank and appreciate the efforts and moral support provided by the lecturers, my colleagues and the staff of the Department of Oral and Maxillofacial surgery, and all the staff in the Division of Oral radiology were an invaluable asset to my work.

I would like to express my gratitude to FnjanCom Sdn Bhd (867118-D) company and their programmers who helped us in coding the MC-SIM application mentioned in Chapter 7.

I offer my regards and blessings to all of those who supported me in any respect during the completion of the project.

Most of all, I would like to express my deepest gratitude to;

My father, Dr.Yousif Alsewaidi for making me what I am today.

My mother, Madam Na'met for her eternal love and care.

My wonderful, understanding and lovely wife, Maryam, for being a pillar of moral support and patience throughout this period. Thank you for your cooperation, collaboration and coordination.

My loving and precious children, Yousif and Teeba for all of their energizing, galvanizing and vitalizing acts which kept me going through this period.

My brother Aws, sister Mays, my cousin Ayhaab Mustafa, and my friends Khatab Omar, Haider Ahmed, Dr.Hesham Ismail, Noor haithem, Alaaeddin Alweish, Marwan Khalil, Kamal Aldosarry for their immense support in easing my burden and commitments during the period of my study.

Saif Yousif Abdullah

1st of July 2011

DECLARATION

I certify that this research report is based on my own independent work, except where acknowledged in the text or by reference. No part of this work has been submitted for degree or diploma to this or any other university.

Dr. Saif Yousif Abdullah

ABSTRACT

Introduction: The increased neurosensory disturbances and hemorrhage after surgical intervention in the mandibular canal region increased the demand for presurgical planning and proper assessment to avoid those complications.

Aims: Determine the path and course of the mandibular canal of dentate Malaysian patients, mandibular canal diameter, mandibular foramen diameter and the incidence of bifid canal using the Cone Beam Computed Tomography (CBCT).

Materials and Methods: The subjects for this study included imaging of 60 patients (30 males and 30 females) from the Division of Oral radiology, with ages ranging from 20 to 60 years (mean age, 47 years). The samples were selected according to gender, race and age groups. The position of the mandibular canal and mandibular canal diameter were measured at five different locations. Linear measurements were done in the coronal view just posterior to the mental foramen at 10 mm interval (D1, D2, D3, D4 and D5). Mandibular foramen diameter and incidence of bifid mandibular canal were also recorded. The samples were imaged using CBCT and SimPlant software and data analyzed through SPSS (v.12).

Results: In this study the mandibular canal was identified in all samples with 100% good visibility. The measured data were expressed as minimum, maximum, median, K-S value and mean \pm standard deviation. The results showed that the position of the right mandibular canal is similar to the position on the left side of the jaw.

Apicocoronal position of the mandibular canal showed that the superior measurements were 14.85 ± 3.64 mm at D1, 13.94 ± 3.85 mm at D2, 12.99 ± 4.08 mm at D3 and 14.22 ± 1.52 mm at D4. The inferior measurements of the canal was 9.37 ± 1.69 mm at D1, $8.24 \pm$

1.69 mm at D2, 7.96 ± 1.93 mm at D3, 9.65 ± 2.54 at D4 and 15.21 ± 4.18 mm at D5. The buccolingual position were 3.89 ± 1.00 mm (buccal) and 4.33 ± 1.25 mm (lingual), 5.59 ± 1.20 mm (buccal) and 3.35 ± 1.20 mm (lingual), 6.71 ± 1.34 mm (buccal) and 3.25 ± 1.32 mm (lingual), 5.68 ± 1.63 mm (buccal) and 3.08 ± 1.46 mm (lingual), 4.24 ± 1.59 mm (buccal) and 2.12 ± 1.40 mm (lingual) at D1,D2,D3,D4 and D5 respectively.

The minimum mandibular canal diameter recorded was 2.00 mm and the maximum was 3.40 mm. In this study the average mean was 2.16 ± 0.30 mm with the least mean diameter at D2 location (2.01 ± 0.42 mm) and the largest mean diameter at D1 (2.25 ± 0.47 mm) and D5 (2.25 ± 0.43 mm). The average mandibular foramen diameter was measured to be 2.55 ± 0.43 mm.

The incidence of bifid mandibular canal was greatest in Malays (n=18), followed by Indians (n=9), while no bifid canal was noticed in the Chinese.

Conclusion: Position of the canal changes due to changes in the mandibular bone. Measurements showed that the mandibular canal curves toward the lingual side the more distal it is away from the mental foramen. Apicocoronal assessment of the canal reveals that it is curving downward towards the inferior mandibular border until D3 and then it curves upwards. This CBCT study reveals there are variations in the position of the mandibular canal. It is highly recommended that careful assessment and planning using computed tomographic imaging is done prior to any surgical intervention in the mandibular canal region to avoid untoward complications.
