ABSTRAK

Tasik Bera adalah bersistem lakustrin dan merupakan tasik semulajadi yang terbesar di Malaysia. Penilaian literasi jelas menunjukkan jurang evaluasi kesan persekitaran akibat aktiviti antropogen ke atas tanah dan sumber air dan regim sedimen di kawasan kajian. Sehubungan itu, penentuan taburan semula tanah dan nutrien di kawasan lembangan, kadar proses persedimenan, penilaian perubahan nutrien dan kualiti sedimen di Tasik Bera dengan menggunakan jatuhan radioisotop ^{210}Pb and ^{137}Cs dan garis panduan kualiti sedimen telah ditakrifkan sebagai objektif kajian ini.

Metodologi yang komprehensif telah di rangka untuk melaksanakan kajian literasi, inovasi alatan persampelan teras sedimen, survei lapangan, pengukuran eksperimen yang terperinci, pemetaan dan permodelan yang terkini. Kepelbagaian data set daripada model dan geo rujukan “GIS-tersedia” telah menyokong reka bentuk metodologi.

Aplikasi jatuhan inventori ^{137}Cs dan perkadaran model telah menrumuskan kadar purata hakisan tanah 915 ± 345 , 117 ± 36 dan 70 ± 35 , $\text{t h}^{-1} \text{th}^{-1}$ masing-masing bagi kawasan yang telah dibersihkan, kawasan perladangan baru dan lama. Kawasan kajian menunjukkan korelasi negatif di antara kandungan nutrien dan perluasan pembangunan tanah.

Pentarikan statigrafi berdasarkan rekod-rekod jumlah jatuhan ^{137}Cs and ^{210}Pb yang diperolehi daripada kolum sedimen di Tasik Bera walau bagaimanapun secara relatifnya kekal malar. Keadaan ini membolehkan model CRS diaplikasikan untuk geokronologi sedimen di Tasik Bera. Kadar maksimum ^{210}Pb dan sedimentasi yang di kira dianggarkan masing-masing adalah $159\pm 2 \text{ Bq cm}^{-2} \text{y}^{-1}$ and 2.56 cm y^{-1} bagi kawasan

separuh tertutup di utara Tasik Bera. Kadar purata sedimentasi pra 1950 ialah sebanyak $0.08 \pm 0.02 \text{ g cm}^{-2} \text{ y}^{-1}$ ($0.1 \pm 0.1 \text{ cm y}^{-1}$) dan jelas menunjukkan akumulasi yang seragam sebelum adanya kesan aktiviti-aktiviti antropogen. Kadar sedimentasi meningkat secara drastik iaitu sebanyak 10 kali ganda sejak 1972 kesan permulaan fasa- fasa pembasmian hutan. Sehubungan itu, satu lapisan lumpur berpasir putih terenap secara drastik di antara 1972 dan 1993 di bahagian selatan, tengah dan utara Tasik Bera dengan kadar purata sebanyak 0.48 ± 0.48 , 0.54 ± 1.2 and $0.17 \pm 0.12 \text{ g cm}^{-2} \text{ y}^{-1}$.

Kewujudan ladang sawit matang telah meningkatkan produktiviti biojisim sebanyak 1.5 mil y^{-1} menyebabkan aliran air permukaan didominasi oleh bahan organik dengan kadar purata akumulasi sebanyak $0.2 \pm 0.1 \text{ g cm}^{-2} \text{ y}^{-1}$ (1.3 cm y^{-1}) di bahagian teratas jujukan lapisan sedimen di Tasik Bera semenjak 1994. Secara keseluruhannya, kadar sedimentasi menggunakan pentarikan ^{210}Pb dan CRS model, jatuhan ^{137}Cs dan model perkadaran dengan nilai kecekapan penjerapan dan luahan sedimen yang diperolehi masing-masing adalah sebanyak 0.99 , 1.025 , and 1.11 cm y^{-1} .

Berdasarkan garis panduan kualiti sedimen menunjukkan pencemaran ketara bahan enapan di Tasik Bera oleh logam As dan di bahagian utara oleh logam Fe. Selain itu, profil sedimen Tasik Bera menunjukkan pencemaran sederhana oleh logam Cu, Cr dan Ni. Eutrofikasi sangat jelas berlaku di Tasik Bera kesan akibat fasa-fasa pembasmian hutan di kawasan lembangan.

Sebagai rumusan, keberhasilan kajian ini membolehkan keyakinan terhadap kaedah terpilih yang digunakan untuk mencapai objektif kajian ini. Kajian ini secara jelas telah menyumbang kepada ilmu pengetahuan berkenaan kaedah yang sesuai untuk menentukan kadar hakisan tanah di kawasan perladangan kelapa sawit di Malaysia dan

kadar sedimentasi dan penjanana semula sejarah tasik semulajadi, penilaian kualiti sedimen yang terenap dan pelan pengurusan bersepadu untuk penggunaan tanah, air dan pemuliharaan tanah yang mapan.

ABSTRACT

The Bera Lake is a lacustrine system and the largest natural lake in Malaysia. Assessment of literature review has highlighted a clear gap in the evaluation of environmental impacts of anthropogenic activities on the soil and water resources and sedimentary regime. Accordingly, determination of soil and nutrient redistribution in the catchment area, and sedimentation rates, nutrients fate and sediment quality assessment at Bera Lake using fallout ^{210}Pb and ^{137}Cs radioisotopes and sediment quality guidelines have been defined as aims of the present research.

A comprehensive methodology was formulated to perform an effective literature review, innovation of core sampler, field surveying, detailed experimental measurements, mapping, and an advanced modeling. A wide range of models and a geo-referenced “GIS-ready” data set have supported the designed methodology.

Application of fallout ^{137}Cs inventories and proportional model provide the mean of soil erosion of 914 ± 345 , 117 ± 36 , and 70 ± 35 , $\text{t h}^{-1} \text{y}^{-1}$ in cleared lands, immature and mature oil palm plantations. A negative correlation between nutrient contents and the extent of land development was established in the study area

Stratigraphic dates based on records of fallout ^{137}Cs and ^{210}Pb supply rates to Bera Lake sediment columns have remained relatively constant. As a result, the CRS model is applied for geochronology of Bera Lake sediments. The estimated maximum ^{210}Pb flux and sedimentation rate were $159\pm2 \text{ Bq cm}^{-2} \text{y}^{-1}$ and 2.56 cm y^{-1} , respectively in the semi-closed area at the north of Bera Lake. The mean pre-1950 sedimentation rate was $0.08\pm0.02 \text{ g cm}^{-2} \text{y}^{-1}$ ($0.1\pm0.1 \text{ cm y}^{-1}$), which indicate a uniform accumulation trend prior to anthropogenic activities. Sedimentation rates raised were by 10 times since 1972

following deforestation. Accordingly, a white sandy mud layer was deposited between 1972 and 1993 at the south, middle, and the north of Bera Lake at mean rates of 0.48 ± 0.48 , 0.54 ± 1.2 and $0.17 \pm 0.12 \text{ g cm}^{-2} \text{ y}^{-1}$.

Establishment of mature oil palm plantations are promoting biomass productivity to 1.5 mil y^{-1} , dominates organic matters in run-off and accumulation of organic-rich deposits at mean rate of $0.2 \pm 0.1 \text{ g cm}^{-2} \text{ y}^{-1}$ (1.3 cm y^{-1}) at the uppermost layer of Bera Lake sediment sequence since 1994. Overall sedimentation rates in Bera Lake basin using ^{210}Pb date and CRS model, fallout ^{137}Cs and proportional model, and trap efficiency and sediment discharge values were 0.99, 1.025, and 1.11 cm y^{-1} , respectively.

Sediment quality guidelines have shown that lake deposits severely polluted by As and the north part polluted by Fe. Besides, Bera Lake sediment profiles are moderately polluted by Cu, Cr, and Ni. A clear eutrophication in Bera Lake has occurred due to deforestation phases in the catchment area.

To sum up, achievements have confidently approved capability of selected methods to achieve the research objective. Present study has remarkably contributed in knowledge due to formulation of the suitable method to estimate soil erosion in oil palm plantations in Malaysia, and sedimentation rates and reconstruction history of a natural lake, assessment of sediment quality and an integrated management plan for a sustainable land use and conservation of water and soil.

ACKNOWLEDGEMENTS

First and foremost I offer my sincerest gratitude to my supervisors, Professor, Dr. John Kuna Raj and Associate Professor Dr Ismail Yusoff, and Co-supervisors, Professor, Dr. Zainudin Othman and Associate Professor, Dr. Wan Zakaria Wan Muhamad Tahir, whose encouragement, supervision and support from the initial to the concluding level enabled me to develop an understanding of the subject. I attribute the level of my Doctor of Philosophy degree to their encouragement and effort and without them this thesis, too, would not have been completed or written.

The great acknowledge go to Professor Dr. Dess Walling, Exeter University, UK for his valuable advises to chose suitable model to estimate soil erosion at my study area. I offer my sincerest gratitude to Professor Dr. Peter Appleby, Liverpool University, UK for his great advises and geochronology calculation model to determine sedimentation rate in Bera Lake. I would like to show my gratitude to Professor Dr. Lee Kheng Heng and Professor Dr. Lionel Mabit, IAEA staff for their heartily helps to provide soil erosion conversion models.

I am acknowledging the Soil Conservation and Watershed Management Research Institute, Iran and Institute of Research Management and Monitoring (IPPP), University Malaya for their valuable executory and financial supports to accomplish this research.

I would like to show my gratitude to Professor Dr. Azman A.Ghani the Head of Geology Department for his great official supports and to Dr. Zal U'un Wan Mahmood, Academic staff of Nuclear Malaysia, for advice and guidance the sediment age calculation models. I owe my deepest gratitude to the Mr. Yii Mee Wo, Gama-

Spectrometer Lab Manager, Nuclear Malaysia for his great guidance in the more esoteric methods necessary to run Gama-spectrometer and deeply thank to technicians of Gama-Spectrometer Lab, Mr. Ishak Kamarozaman, and Mr. Mr. Johari Abd Latif for their effective helps during analysis of samples for radioisotopes inventory.

I would like to show my gratitude to my friend Mr. Muhammad Aqeel Ashraf, for his kindly assistant to complete my writing up the thesis. I am also grateful to Mr. Mohd Yusri Abdul Rahim, Hydrology Lab, Geology Department, for his kindly helps in running the equipments especially during ICP-OES operation. I would like to thank to RAMSAR site Director, Mr. Amin and Mr. Ahmad Farid Abu Bakar for their kindly supports and helping in the field works.

I owe my deepest gratitude to my Parents, and my Brothers who gave me the financial and moral supports. I am indebted to my many of my colleagues in Soil Conservation and Watershed Management Research Institute for their contribution in the official and departmental supports.

I offer the heartily and sincerest acknowledgment to my family members, especially my wife, Mahboubeh Hadadfard, and my daughters, Zahra, Roghayeh, and Sara, whose encouragement, assistance and support from the beginning to the concluding level enabled me to accomplish this project.

Lastly, I offer my regards and blessings to all of those who supported me in any respect during the fulfillment of the project and getting to the Doctor of Philosophy degree.

Mohammadreza Gharibreza

This thesis is sincerely dedicated to my family.
Their support, encouragement, and constant assistance
have sustained me throughout my life

Figure 9.7: Feasibility of mature oil palm integrate into cattle feeding.....	241
Figure 9.8: Application of empty fruit bunches for soil redistribution controlling	243

LIST OF TABLES

Table 2.1: Physical properties of radionuclides (IAEA, 2001).....	11
Table 3.1: Quality control results of ICP-MS using SRMs (4354) freshwater lake sediment standard samples.....	43
Table 3.2: CRS model running for calculation of sediment date, and flux	54
Table 3.2: List of parameter requirements for individual models	58
Table 3.4 Sediment quality indices which were applied in this study (mg kg^{-1}).....	63
Table 4.1: Physiographic and drainage characteristics of Bera Lake watershed.....	70
Table 4.2: Land use and natural land cover of BLC	89
Table 4.3: Soil particle size distribution at different land use areas	92
Table 4.4: Contribution of water and sediment entry points in Bera Lake.....	95
Table 4.5: Water quality characters of Pos Iskandar open water, IBP, 1972	103
Table 4.6: Bera Lake <i>in-situ</i> water quality sampling results	104
Table 4.6: Bera Lake water quality based on NWQS and WQI guidelines.....	112
Table 4.7a: Sediment size distribution in master core 7 and statistical parameters.....	118
Table 4.7c: Sediment size distribution in master core 7 and statistical parameters.....	118
Table 4.7d: Sediment size distribution in master core 7 and statistical parameters	119
Table 4.7e: Sediment size distribution in master core 7 and statistical parameters.....	119
Table 4.7f: Sediment size distribution in master core 7 and statistical parameters	119
Table 4.7g: Sediment size distribution in master core 7 and statistical parameters	120
Table 4.8: Mean bulk density (g cm^{-3}) of Bera Lake sediment layers	120
Table 5.1: ^{210}Pb inventory and flux in sediments cores	128
Table 6.1: ^{137}Cs inventory, grain size distribution, and classification of studied samples	155
Table 6.2: Soil loss, erosion magnitude, and erosion rate at BLC.....	160
Table 6.3 Nutrient contents, ^{137}Cs inventory, and physical properties of soil samples ...	164

Table 6.4: ^{137}Cs inventory and accumulation rate in wetlands and open waters samples	167
Table 7.1: Major and minor metals background levels in Bera Lake	177
Table 7.3: Strong positive correlation (r -value>0.7) between metalloid elements.....	183
Table 7.4: Contamination factor and degree of contamination for cores 2, 5, and 6.....	193
Table 7.5: Ecological risk index for individual metals and for basin in Cores 2, 5, and 6	194
Table 7.6: POC (dry weight) content in analyzed samples of master Cores 2, 5, and 6..	204
Table 9.1: Agro forestry system, The Third National Agriculture Policy (Ahmad, 2001)	239

LIST OF ABBREVIATION

AWB	:	Asian Wetland Bureau
BLC	:	Bera Lake Catchment
BP	:	Before Present
Bq m ⁻²	:	Becquerel per square Meter
Bq m ⁻² y ⁻¹	:	Becquerel per square Meter per Year
CBSQG	:	Consensus-Based Sediment Quality Guidelines of Wisconsin
cm y ⁻¹	:	Centimeter per Year
CF:CS	:	Constant Flux: Constant Supply
C _f	:	Contamination Factor
CIC	:	Constant initial concentration model
Cl ⁻	:	Chloride
CRS	:	Constant rate of supply model
CV	:	Coefficient of Variation
¹³⁷ Cs	:	Fallout Caesium-137 Radionuclide
DEM	:	Digital Elevation Model
DWNP	:	Department of Wildlife and National Parks
D _f	:	Degree of Contamination
DO	:	Dissolved Oxygen
EC	:	Electric conductivity
EF	:	Enrichment Factor
EFB	:	Empty Fruit Bunches
EIA	:	Environmental Impact Assessment

E_r	: Potential Ecological Risk Factor for Individual Metal
FELDA	: Federal Land Development Authority
FWHM	: Full Width at Half Maximum
GC	: Gas Chromatographic
GIS	: Geographical Information System
$g\text{ cm}^{-3}$: Gram per cubic Centimeter
H_3BO_4	: Boric Acid
HCA	: Hieratical cluster analysis
HCl	: Chloride Acid
HF	: Fluoride Acid
HNO_3^{1-}	: Nitrate Acid
LDO	: Lowest Dissolved Oxygen
LEL	: Lowest Effect Level
LGM	: Last Glacial Maximum
ICP-MS	: Inductively Coupled Plasma Mass Spectrometry
ICP-OES	: Inductively Coupled Plasma Optic Emission Spectrometry
IAEA	: International Atomic Energy Agency
Igeo	: Index of Geoaccumulation
IRBM	: Integrated River Basin Management
ISQG	: Interim Fresh Water Sediment Quality
IWRM	: Integrated Water Resource Management
MACRES	: Malaysian Centre for Remote Sensing
MPOB	: Malaysian Oil Palm Board

mg l ⁻¹	: Milligram per Liter
mg kg ⁻¹	: Milligram per Kilogram
MnCO ₃	: Manganese Carbonate
NH ₄ ⁺¹	: Ammonia
NE-SW	: North East- South West
NO ₃ ²⁻	: Nitrate
NO ₂ ⁻¹	: Nitrate
NW-NE	: North West-North East
NWQS	: National Water Quality Standards for Malaysia
²¹⁰ Pb	: Fallout Lead-210 Radionuclide
PEL	: Probable Effect Level
PFE	: Permanent Forest Estate
pH	: Acidity
POC	: Particular Organic Carbon
PO ₄	: Phosphate
PPM	: Per Part Million
RI	: Potential Ecological Risk Factor for Basin
QAQC	: Quality Assurance and Quality Control
SQG	: Sediment Quality Guidelines
SEL	: Severe Effect Level
SRM	: Standard Reference Material
SW	: South West
t h ⁻¹ y ⁻¹	: ton per hectare per year

TCD	:	Thermal Conductivity Detection
TDS	:	Total Dissolved Solid
TOC	:	Total Organic Carbon
TN	:	Total Nitrogen
USLE	:	Universal Soil Loss Equation
WGS	:	World Geographic Coordinate System
