Subscribed and solemnly declared before,

Witness’s Signature Date: 30 April 2012

Name: Dr Sharifah Mohamad

Designation: Lecturer
ABSTRACT

The non-covalent interaction of beta-cyclodextrin (β-CD), dithizone (H₂Dz) and dithizone-zinc (H₂Dz-Zn) complex was studied in detail. Solid samples were studied using solid state $^{13}$C Cross Polarization and Magic Angle Spinning spectroscopy ($^{13}$C CP/MAS NMR), Fourier Transform Infrared spectroscopy (FTIR), Thermal Gravimetric Analysis (TGA), Differential Scanning Calorimetry (DSC), Powder X-Ray Diffraction (XRD) and Energy Dispersive X-ray (EDX) to investigate the formation of the inclusion complex. Spectrophotometric technique was also used to assess the formation of inclusion complex in liquid form. The characterization results supported the formation of inclusion complex. The results showed that β-CD formed a complex with H₂Dz in a ratio of 2:1 and with H₂Dz-Zn in a ratio of 1:1. A spectrophotometry method was developed based on the enhancement of the absorbance of dithizone-zinc complex produced through complex formation in the presence of β-CD. A linear relationship between absorbance and concentration of zinc was obtained in the range of 0.1 – 9.0 mg/L with correlation coefficient of 0.996. The detection limit obtained was 0.005 mg/L and the relative standard deviation (R.S.D) was 2.05%. The developed method was applied in real samples and the recoveries obtained were from 85 – 95%.
ABSTRAK

Interaksi bukan kovalen antara kompleks beta-siklodekstrin (β-CD) dan ditizon (H₂Dz) serta ditizon-zink (H₂Dz-Zn) telah dikaji dalam dua bahagian. Sampel pepejal telah dikaji dengan menggunakan kaedah Spektroskopi Resonans Magnet Nukleus Keadaan Pepejal $^{13}\text{C}$ (solid state $^{13}\text{C}$ CP/MAS NMR), Spektroskopi Inframerah (FTIR), Analisis Termagrarimetri(TGA), Kalorimetri Pengimbasan Pembezaan (DSC), Belauan sinar-X (XRD) dan Tenaga Sinar-X Serakan (EDX) untuk menyiasat pembentukan kompleks. Teknik spektrofotometri juga digunakan untuk menyiasat pembentukan kompleks dalam medium cecair. Keputusan pencirian menunjukkan bahawa telah berlaku pembentukan kompleks. Keputusan menunjukkan bahawa β-CD membentuk kompleks bersama H₂Dz di dalam nisbah 2:1 manakala bersama H₂Dz-Zn, ia membentuk kompleks di dalam nisbah 1:1. Disebabkan peningkatan serapan hasil daripada kompleks H₂Dz-Zn, maka kaedah spektrofotometri telah dibina untuk mengesan zink bersama kehadiran β-CD. Perhubungan linear di antara serapan dan kepekatan zink telah didapati di antara julat 0.1 – 9.0 mg/L dengan pekali korelasi 0.996. Had pengesanan yang ditemui adalah 0.005 mg/L dan sisihan piawai relatif ialah 2.05%. Kaedah yang dibina telah diaplikasikan kepada sampel sebenar dan kebolehdapatan yang didapati adalah di antara 85 – 95%.
ACKNOWLEDGEMENT

Alhamdulillah, with the blessing of Allah, I am able to complete my research and dissertation according to the time frame given. First of all, I would like to express my sincere gratitude to my supervisor, Dr. Sharifah Mohamad for her guidance, encouragement, supports, comments and suggestions throughout my research and upon preparing this dissertation.

I would also like to thank all my lab mates at Analytical Research Laboratory (K012), Department of Chemistry, Faculty of Science, University of Malaya for their supports and helps when I needed. Not to forget, my family members, especially both of my parents, Mohd Kamal Bin Abd. Rahman and Rasida Bt Osman who have been supporting me in my studies and also to all science officers in Department of Chemistry, Department of Physics and Combicat for their valuable help, guidance and kindness. Not to forget, to all my friends for their direct or indirect supports and encouragements throughout my studies.
