Abstract	i
Abstrak	ii
Acknowledgement	iii
Contents	iv
List of Figures	viii
List of Plates	x
List of Tables	xi
1 : INTRODUCTION	
1.1 Landfill in Malaysia	1
1.2 Landfill Functionality: Sink vs Reservoir	1
1.3 Waste and Material Flow	3
1.4 Mass & Element Balances in Municipal Solid Waste Landfill	3
1.5 Carbon and Nitrogen Mass Balance in Landfill	5
1.6 Problem Statement and Objectives	6
2 : LITERATURE REVIEW	
2.0 Municipal Solid Waste Generations Trends	
2.0.1 Global Trends	7

2.0.2 Regional Trends	11
2.0.3 National Trends	13
2.1 Historical background and development of Material Flow Analysis.	16
2.2 Progress in the study of Material Flow Analysis.	26
2.3 Application of Material Flow Analysis in Municipal Solid Waste Management (MSW).	34
2.4 Landfill as a sink	35
2.5 Waste and Climate Change	38
2.6 Carbon Flows Through Waste Management Systems	
2.6.1 Carbon Cycle Process in Sanitary Landfill	43
2.6.2 Global Greenhouse Gas Emission Trend	45
2.6.3 Methane as a Greenhouse Gas.	46
2.7 Nitrogen Flows Through Waste Management Systems	
2.7.1 Nitrogen Removal and Transformation Process in Landfill	49
2.7.2 Ammonia-nitrogen removal in leachate and gas.	50
3: MATERIALS AND METHOD	
3.1 System Analysis in Jeram Sanitary Landfill (JSL)	
3.1.1 Field site :Background Primary Data Collection	53
3.1.2 Sampling of Municipal Solid Waste (MSW)	54
3.1.3 Chemical Analysis for MSW characterization	55
3.1.4 Physical and Chemical Analysis for leachate and rainwater and gas.	56
3.2. MFA framework in Sanitary Landfill System	
3.2.1 System Analysis	58

3.2.2 Municipal Solid Waste (MSW) Degradation :	60
The stoichiometric model	
3.2.3 Quantitative Analysis on Waste Input : MSW	60
3.2.4 Carbon Mass Balance	61
3.2.5 Nitrogen Mass Balance	61
3.3 Quantitative Analysis on Waste Output : Leachate and Greenhouse Gases (GHG)	
3.3.1 Water Balance Factor in Landfill	62
3.3.2 Conceptual Model.	62
3.3.3 Water Balance Modelling (WBM)	63
3.4 The Landfill Gas Emission (LandGEM) software application	
3.4.1 GHG projection in landfill condition	65
3.5 Data Modelling approach : Substance Analysis software (STAn)	
3.5.1 Short Operating Program Description: Flow analysis and Mass Balance	66
3.5.2 Overall Mass Balance in Sanitary Landfill Sytem	68
3.5.3 Substance flow Analysis for Carbon and Nitrogen	72
4 : RESULTS AND DISCUSSION	
4.1 System Analysis in Jeram Sanitary Landfill (JSL)	
4.1.1 Municipal Solid Waste (MSW) characterization/ Composition Studies	73
4.1.2 Physical and Chemical Analysis for leachate and rainwater	79
4.1.3 Emission from small-scale composting	79

4.2 MSW Characterization & Flow in JSL	
4.2.1 Quantitative Analysis on Waste Input : MSW	81
4.2.2 Quantitative Analysis on Waste Output : Leachate and Greenhouse Gases (GHG)	83
4.3 Water Balance Factor in Landfill	
4.4.1 Precipitation in terms of Rainfall in JSL	85
4.4.2 Water Balance (Leachate and Rainfall)	86
4.4 The Landfill Gas Emission (LandGEM) application	
4.4.1 GHG emission projection for 10 years.	94
4.5 Data Modelling approach : Substance Analysis software (STAn)	
4.5.1 Substance flow Analysis for Nitrogen	101
4.5.2 Substance flow Analysis for Carbon	114
5: CONCLUSION	127
