

## **ABSTRACT**

Acupuncture is a technique for inserting needles into the body to introduce anesthesia or reduce pain. In detail, acupuncture basically is a procedure involved with stimulation of anatomical locations on or in the skin by using different types of techniques. Acupuncture is used for maintaining condition of body or treats human diseases for thousands of years. This thesis concerns the bioimpedance parameters (BI) and body composition parameters of people before and after undergoing acupuncture therapy. To measure bioimpedance (BI) parameters of normal subject and patients before and after acupuncture therapy I need to calculate the body composition parameters using Quadscan 4000. Also I need to make an analysis and comparison between BI parameters before and after acupuncture therapy. The main purpose of this study is to investigate the effect of acupuncture before and after acupuncture in term of resistance (R); reactance (X); impedance (Z); Phase angle; and capacitance (C) of female and male subjects that can be measured as bioimpedance (BI) parameters. The body composition parameters included with Fat Free Mass (FFM); Intracellular Water (ICW) Fat Mass (FM); Total Body Water (TBW); Extracellular Water (ECW) Basal Metabolic Rate (BMR) and are calculated based on bioimpedance (BI) parameters. All these parameters analyzes by using statistical analysis program called SPSS.

## **ABSTRAK**

Akupuntur adalah satu teknik memasukkan jarum ke dalam badan untuk memperkenalkan anestesia atau mengurangkan kesakitan.Secara terperinci, akupuntur pada asanya adalah satu prosedur yang terlibat dengan rangsangan lokasi anatomi pada atau dalam kulit dengan menggunakan pelbagai jenis teknik.akupuntur digunakan untuk mengekalkan keadaan badan atau merawatpenyakit-penyakit manusia selama beribu ribu tahun.Tesis ini melibatkan parameter bioimpedance(BI) dan parameter komposisi badan orang sebelum dan selepas menjalani terapi akupuntur.Untuk mengukur bioimpedance(BI) parameter subjek normal dan pesakit sebelum dan selepas terapi akupuntur, parameter komposisi badan akan dikira yang menggunakan Quadscan 4000.Analisis perbandingan antara parameter BI sebelum dan selepas terapi akupuntur akan dilakukan .Tujuan utama kajian ini adalah untuk menyiasat kesan akupuntur sebelum dan selepas akupuntur dalam bentuk rintangan (R); regangan(X); galangan(Z);sudut Fasa; dan kemuanan(C) untuk subjek lelaki dan wanita yang boleh diukur sebagai parameter bioimpedance(BI).Parameter komposisi badan termasuk dengan Massa Lemak Bebas (FFM);Air intraselular (Komanwel) Lemak Massa (FM);Jumlah air dalam Badan(TBW);Air Extracellular(ECW),Kadar Metabolik pangkal (BMR) dan dikira berdasarkan bioimpedance (BI) parameter.Kesemua parameter dianalisis dengan menggunakan program analisis statistic yang dipanggail SPSS.

## **ACKNOWLEDGEMENT**

I am very grateful to Almighty Allah at first for finishing my master dissertation project successfully. I would like to express my profound gratitude to my supervisor Associate Professor.Dr. Wan Mohd Azhar Bin Ibrahim from the Department of Biomedical Engineering, University of Malaya, Malaysia for his guidance throughout all phases o my dissertation project. I would like to thank him for his co-operation to me. His suggestions help me to complete me project.

I would also like to take this opportunity to thank all my lecturers in Biomedical Engineering Department for their guidance and advice.

I would also like to thank my dearest husband Abu Naser Hossain , my sister Noor Rosnani Bt Ibrahim and parents Mohammed Abdul Hamid and Mrs. Khaleda Hamid for their love and moral support. Thanks for everything to all those involved directly or indirectly in helping me out in completing this task.

Thank you.
