ABSTRACT

In Malaysia, located in the hot, humid equatorial region, malaria stills an important public health issue among rural and aboriginal people. In parallel with the implementation of Malaysia's malaria elimination programme, this cross-sectional was carried out among 223 households from forest-aboriginal and rural areas, Lipis district, Pahang state, to investigate the awareness of the communities regarding malaria: knowledge, attitudes and practices (KAP) and to establish a preliminary ethnobotanical database for the plants traditionally used to treat malaria. The *in vivo* anti-malarial activity of the methanol extracts of *Cocos nucifera*, *Labisia pumila*, *Languas galanga* and *Piper betle* selected based on the ethnobotanical survey were evaluated against the laboratory malaria model *Plasmodium berghei*. The acute oral toxicity (LD₅₀) was determined to ascertain the safety of the extracts. The phytochemical and antioxidant potentials of the crude extracts were also investigated to elucidate the possibilities of its anti-malarial effects. The rural population has shown a higher knowledge about the transmission of the disease (aboriginal 50%, rural 70.7%, $P < 0.01$). However, the aboriginal participants showed higher practices in the use of medicinal plants and belief in witchcraft ($P < 0.05$, $P < 0.01$, respectively). On the other hand, the two communities did not show significant differences in their knowledge, attitudes and practices about the symptoms of malaria, severity of the disease and the use of mosquito bed nets, respectively. Nineteen species belonging to 17 families were identified. Twelve plant species have not previously been documented for the treatment of malaria in Peninsular Malaysia. The results of anti-malarial activity of *C. nucifera*, *L. pumila*, *L. galanga* and *P. betle* showed significant ($P < 0.05$) results during the early, established and residual *P. berghei* infections in mice. Overall results of the *in vivo* anti-malarial activity of the methanol extract of the plants during early, established and residual malaria infections with evidence of increasing mean survival time of the infected mice showed that *P.*

betle and *L. galanga* were the most effective followed by *C. nucifera* and *L. pumila*, respectively. The present study showed that the test extracts are toxicologically safe by oral administration. Phytochemical screening of the methanol extracts of the plants revealed the presence of alkaloids, terpenoids, anthraquinones, flavonoids, tannins, saponins, glycosides and steroids. At a concentration of 25 µg/mL *P. betle* showed potent DPPH scavenging antioxidant activity % (80.68%) followed by *L. pumila* (40.66%) and *L. galanga* (37.88%) where as *C. nucifera* exhibited a weak DPPH scavenging activity (5.52%). In conclusion, the aboriginal and rural communities showed awareness regarding malaria as a disease; however their KAP were inadequate, in particular, among the aboriginal population. Providing efficient health education to people residing in malaria endemic areas would improve their understanding about malaria prevention in order to bring about the elimination of malaria from the country. The ethnobotanical findings can be used as an ethnopharmacological basis for selecting plants for further anti-malarial phytochemical and pharmaceutical studies. The anti-malarial activity observed in this study also confirms that the Malaysian folkloric medicinal application of these plants has a pharmacological basis.

ABSTRAK

Di Malaysia, yang terletak di kawasan Khatulistiwa yang panas dan lembab, dimana penularan malaria adalah reseptif dan mudah dialami, malaria masih menjadi isu kesihatan awam yang penting di kawasan luar bandar dan pendalaman. Selari dengan implimentasi program pembasmian malaria di Malaysia, kajian 'cross-sectional' dengan soal selidik separuh struktur telah dijalankan dikalangan 223 isi rumah dari kalangan Orang Asli di hutan dan dari penduduk kawasan luar bandar, daerah Lipis, Negeri Pahang, untuk menyiasat kesedaran komuniti mengenai malaria (pengetahuan, sikap dan amalan) dan untuk membentuk satu databes etnobotanikal priliminari bagi pokok-pokok yang digunakan secara tradisional untuk merawat malaria. Aktiviti anti-malaria *in vivo* bagi ekstrak methanol *Cocos nucifera*, *Labisia pumila*, *Languas galanga* dan *Piper betle* telah dipilih berasaskan tinjauan etnobotanikal dan dinilai menentang model malaria makmal *Plasmodium berghei*. Toksisiti oral akut (LD_{50}) telah ditentukan bagi mencapai tahap selamat ekstrak tersebut. Fitokimia dan potensi antioksidan bagi ekstrak mentah juga telah disiasat untuk memastikan kemungkinan terdapat kesan anti-malaria. Penduduk luar bandar telah menunjukkan pengetahuan lebih tinggi tentang penularan penyakit ini (Orang Asli 50%, luar bandar 70.7%, $P < 0.01$). Bagaimanapun, penggunaan pokok berubat dan kepercayaan pada ilmu sihir dan sihir dalam merawat penyakit demam adalah lebih tinggi signifikananya di kalangan penduduk Orang Asli ($P < 0.05$, $P < 0.01$, masing-masing). Sebaliknya, tidak ada perbezaan yang signifikan diantara kedua komuniti dari segi pengetahuan tentang simptom malaria, sikap terhadap penyakit yang teruk dan amalan pencegahan malaria menggunakan kelambu. Sembilan belas spesies pokok yang tergolong dalam 17 famili telah dikenalpasti. Dua belas spesies pokok belum pernah didokumenkan sebelum ini untuk rawatan malaria di Semenanjung Malaysia. Keputusan aktiviti anti-malaria bagi *C. nucifera*, *L. pumila*, *L. galanga* dan *P. betle* menunjukkan yang setiap dari empat ekstrak pokok tersebut

mempamerkan aktiviti malaria supresi aktif lebih dari 30% terhadap jangkitan *P. berghei* dalam tikus semasa ujian supresif 4 hari. Keputusan keseluruhan dengan bukti peningkatan masa min survival menunjukkan yang *P. betle* dan *L. galanga* mengurangkan parasitemia secara signifikan ($P < 0.05$) dan meningkatkan masa survival tikus yang terjangkit. *C. nucifera*, *L. galanga* dan *P. betle* juga menunjukkan aktiviti anti-malaria yang signifikan ($P < 0.05$) semasa jangkitan malaria residual. Kajian ini menunjukkan yang ekstrak ujian adalah secara toksikologinya selamat diberi melalui oral. Ujian fitokimia ekstrak methanol bagi pokok-pokok ini menunjukkan wujudnya alkaloid, terpenoid, antraquinone, flavonoid, tanin, saponin, glikosid dan steroid. Pada kepekatan 25 µg/mL, *P. betle* menunjukkan aktiviti poten DPPH ‘scavenging’ antioksidan (80.68%) diikuti oleh *L. pumila* (40.66%) dan *L. galanga* (37.88%) dimana *C. nucifera* menunjukkan aktiviti DPPH ‘scavenging’ yang lemah (5.52%). Kedua-dua komuniti sedar akan malaria sebagai penyakit, tetapi pengetahuan, sikap dan amalan mereka tidak memadai, khususnya, di komuniti Orang Asli. Dengan membekalkan pelajaran kesihatan yang efisien kepada orang-orang yang tinggal di kawasan endemik malaria akan meningkatkan kefahaman mereka tentang pencegahan malaria untuk menuju kearah pembasmian malaria dari negara ini. Penemuan etnobotanikal boleh digunakan sebagai asas etnofarmakologi untuk memilih pokok-pokok bagi kajian fitokimia dan farmaseutikal selanjutnya. Aktiviti anti-malaria yang dilihat dalam kajian ini juga mengesahkan bahawa aplikasi berubat dari cerita rakyat Malaysia turun-temurun bagi pokok-pokok ini mempunyai asas farmakologi.

AKNOWLEDGMENTS

IN THE NAME OF ALLAH, THE MOST GRACIOUS, THE MOST MERCIFUL

All praise to Allah (SWT) who, alone, brings forgiveness and light and new life to those who call upon Him; and to Him is the dedication of this thesis.

First and foremost, I would like to express my deepest sense of gratitude to my supervisors Associate Prof. Dr. Zurainee Binti Mohamed Nor and Prof. Dr. Rohela Binti Mahmud for taking the initiative to the present work, for excellent counselling, and for continuous support and encouragement. I also appreciated their generosity, warmth and sense of humour which were instrumental in making me confident and making this report possible.

I also would like to express my deepest sense of gratitude to my advisor Dr. Hesham Mahyoub Sarhan Al-Mekhlafi for his help, encouragement and excellent advices throughout this study and sharing his tremendous experience within statistics, clinical trials and publication. I think his presence in the Department of Parasitology was the best thing that could happen to me and my study.

I acknowledge the financial support for this study by University of Malaya (PPP grant; Grant codes PS275/2008A and PS204/2009C). I wish to thank the Director and staff of Institute of Research Management and Consultancy (IPPP) for their cooperation in managing the research grants. I also wish to extend my thanks to Vice-Chancellor of UM, Deputy VC, Dean of IPS, Deputy Dean IPS, Dean of the faculty of Medicine and head of the Parasitology Department and all Professors, lecturers, staff and all my colleagues for their actively support the scientific movement in the university and generous help.

I acknowledge my gratitude to all staff of the Laboratory Animal Centre of the Faculty of Medicine, University of Malaya for their generous support in providing the laboratory animals. My warm thanks and gratitude go to Encik Adnan bin Hussin from UKM (National University of Malaysia) for his generous help in providing the reference drug (chloroquine) and the rodent *Plasmodium* parasite. I wish also to acknowledge Mr. Abdulhamid Ahmed for his generous help in providing the pyrimethamine (SKG-Pharma Limited). I am also very thankful and grateful to Mr. Yong Kien-Thai from the Herbarium of the University of Malaya for his advices and help in the identification of the plant and Mr. Low Yee Wen from the Herbarium of the University of Malaya for his generous help in the collection of the plants. I would also to thank the Ethno Resources Sdn Bhd's, Kuala Lumpur, for their help in providing the dried plants materials.

I am also grateful to Mr. Mohd Pairol Hisham, Ms. Aida Nor Shamsiah and Ms. Cik Fairuz from Clinic Pos Batau, Ms. Faridah Hakim binti Mustafa from Clinic Kesehatan Benta and Mrs. Normah binti Ibrahim from Clinic Kesehatan Padang Tengku for their diligent and fruitful help in the collection of KAP and ethnobotanical questionnaire, and the staff of the Vector-Borne Control Unit of the district of Lipis, Pahang state, for providing the information necessary for the selection of the study areas. I also would like to convey special thanks to all the members of the study sample for their participation and cooperation in this study.

I would also like to thank Associate Prof. Dr. Mahmood Ameen Abdulla, Mr. Pouya Darvish and all staff of the Department of Molecular Medicine, University of Malaya, for their useful help in the antioxidant evaluations and the extraction procedures. I owe a lot to Mr. Zulkifli (Rombin, Pahang), Mr. Abdulhamid Ahmed (UM), Mr. Adel A. Amran (UKM), Mr. Majdi A. Al-Tahat (UKM), Mr. Mohammed

Al-Weshali (UCSI) and Mr. Mohammed Saleh (UM) who helped me during my study within the field and laboratory works.

To Professor Dr. Zainal-Abidin Bin Abu Hasan (UKM) I would like to convey my sincere gratitude for his continuous support, encouragement and show the scientific way. Prof. Dr. Zainal-Abidin was my supervisor during Master programme and his wise style in supervision was instrumental in my achievements. I would also like to thank Dr. Mohammed A. Mahdy, Mr. Wahib M. Atrosh, Mr. Abdulsalam M. Al-Mekhlafi for their generous support during my study. I would like to send my warm thank to my beloved county (Yemen), the Yemeni government, Tamar University for awarding me the scholarship to pursue my postgraduate study and all the staff in the Yemeni Embassy for their generous help.

My utmost thanks and profound gratitude go to my beloved mother Mas'ada binti Mohsen Ali Hasan, beloved father Hussien bin Ahmed Saleh, beloved wife Elham binti Dehan Mohammed, beloved children: Abdullah, Osamah, Maria and Sarah, and my beloved brothers Saleh and Abdullah and sisters Dawlah, Saidah, Khairiah and Rabaah for their constant support, understanding, love, encouragement, patience and taking care of me.

Finally, I would like to take this opportunity to express my profound thanks to this country (Malaysia) and her generous and great people, doa and prayers to be peaceful, rich and be more developed.
