ACKNOWLEDGEMENTS

In the course of completing this research, I have received a great deal of support from a number of people to whom I would like to express my thanks.

Foremost, I am particularly indebted to my supervisor, Assoc. Prof. Dr. Cassey Lee for his encouragement, invaluable advice and useful comments. His wisdom, experience, patience and understanding have been instrumental towards the completion of this research. It has been a great pleasure to work under his supervision.

Many thanks also due to numerous officials from organizations such as Malaysian Communication and Multimedia Commission (MCMC), Kuala Lumpur Stock Exchange (KLSE), Maxis, Celcom, Digi, Tm Cellular and TimeCel for their cooperation and information given. They include Puan Sulyna, Mr. Koay, Intan, Azam, Ridzuan, Farah and Afida. I am also grateful and appreciate the help given by my uncle, Mr. Mak Som for his painstaking effort in proof reading and correcting linguistic mistakes.

Finally, this piece of work is dedicated especially to my parents for their endless prayers for my success and always being the source of inspirations. The same goes to my wife, Ayu and my lovely daughter Amirah for their unwavering support and invaluable encouragement.

ABSTRACT

This research explores and analyzes the change in the productivity of Malaysian mobile telecommunications industry during the period 1996 to 2001. The data consists of a panel of five mobile service providers in Malaysia namely Celcom, DiGi, Maxis, TimeCel and TM Cellular. Productivity has been measured by the Malmquist index, using a Data Envelopment Analysis (DEA) technique. The Malmquist productivity measures are decomposed into two components: technological change and technical efficiency change index. The results showed that Maxis is persistently technically efficient through out the period of the study while TM Cellular and Celcom were the least technically efficient operators under the constant returns to scale (CRS) and variable returns to scale (VRS) versions of technology. Indeed, Maxis was also found to be the major innovator in the industry over the period of the study. The study also finds that Total Factor Productivity (TFP) has increased significantly for the whole industry in which technical progress has been the most important source of productivity growth to Malaysian mobile telecommunications industry. Low technical efficiency in the industry indicates a great potential for the industry to increase productivity through improvement in technical efficiency. Continuously expanding market liberalization and enhancing the productive capacity of technology appears to offer better prospects for Malaysian mobile telecommunications industry to achieve greater productivity growth.
